CompTIA Cybersecurity Analyst (CySA+) Certification Exam Sample Questions (Q110-Q115):

NEW QUESTION # 110

A technician receives a report that a user's workstation is experiencing no network connectivity.

The technician investigates and notices the patch cable running from the back of the user's VoIP phone is routed directly under the rolling chair and has been smashed flat over time.

Which of the following is the most likely cause of this issue?

- A. Split pairs
- B. Cross-talk
- C. Excessive collisions
- D. Electromagnetic interference

Answer: C

NEW QUESTION # 111

A security analyst is monitoring authentication exchanges over the company's wireless network.

A sample of the Wireshark output is shown below:

Which of the following would improve the security posture of the wireless network?

- A. Using UDP instead of TCP
- B. Using SSL 2.0 instead of TLSv1.1
- C. using aspx instead of .jsp
- D. Using PEAP instead of LEAP

Answer: D

NEW QUESTION # 112

The majority of a company's employees have stated they are unable to perform their job duties due to outdated workstations, so the company has decided to institute BYOD. Which of the following would a security analyst MOST likely recommend for securing the proposed solution?

- A. A standardized anti-malware platform and a unified operating system vendor
- B. A Linux-based system and mandatory training on Linux for all BYOD users
- C. A firewalled environment for client devices and a secure VDI for BYOD users
- D. 802.1X to enforce company policy on BYOD user hardware

Answer: D

NEW QUESTION # 113

A developer is working on a program to convert user-generated input in a web form before it is displayed by the browser. This technique is referred to as:

- A. query parameterization.
- B. output encoding.
- C. data protection.
- D. input validation.

Answer: B

Explanation:

Output encoding is a technique that converts user-generated input in a web form before it is displayed by the browser. Output encoding is a form of data sanitization that prevents cross-site scripting (XSS) attacks, which occur when malicious scripts are injected into web pages and executed by unsuspecting users. Output encoding works by replacing special characters in user input, such as <, >, ", ', &, etc., with their HTML-encoded equivalents, such as < <, >, ", ', &, etc. This prevents the browser from interpreting the user input as HTML or JavaScript code and executing it.

NEW QUESTION # 114

During a routine log review, a security analyst has found the following commands that cannot be identified from the Bash history log on the root user.

Which of the following commands should the analyst investigate FIRST?
