Splunk O11y Cloud Certified Metrics User Training Material - SPLK-4001

Updated Torrent & Splunk O11y Cloud Certified Metrics User Reliable Practice

This product is enough to get ready for the SPLK-4001 test on the first attempt. Three formats are easy to use and meet the needs of every Splunk O11y Cloud Certified Metrics User (SPLK-4001) test applicant. The Splunk SPLK-4001 practice material's three formats are Desktop practice test software, web-based practice exam, and PDF.

Splunk SPLK-4001 exam is designed to validate and certify the proficiency of IT professionals in leveraging Splunk's cloud-based metric platform to deliver top-level observability to their organizations. As the trend shifts towards cloud-based infrastructure for organizations' computing needs, there is a growing demand for professionals who can help businesses achieve proper observability utilizing cloud services. The SPLK-4001 Exam is thus essential for tech professionals looking to bolster their careers and stay competitive in the dynamic technology landscape.

Splunk O11y Cloud Certified Metrics User Sample Questions (Q10-Q15):

NEW QUESTION # 10

Which analytic function can be used to discover peak page visits for a site over the last day?

- A. Maximum: Aggregation (Id)
- B. Lag: (24h)
- C. Count: (Id)
- D. Maximum: Transformation (24h)

Answer: D

Explanation:

According to the Splunk Observability Cloud documentation¹, the maximum function is an analytic function that returns the highest value of a metric or a dimension over a specified time interval. The maximum function can be used as a transformation or an aggregation. A transformation applies the function to each metric time series (MTS) individually, while an aggregation applies the function to all MTS and returns a single value. For example, to discover the peak page visits for a site over the last day, you can use the following SignalFlow code:

```
maximum(24h, counters("page.visits"))
```

This will return the highest value of the page.visits counter metric for each MTS over the last 24 hours. You can then use a chart to visualize the results and identify the peak page visits for each MTS.

NEW QUESTION # 11

Which of the following are true about organization metrics? (select all that apply)

- A. A user can plot and alert on them like metrics they send to Splunk Observability Cloud.
- B. Organization metrics are included for free.
- C. Organization metrics give insights into system usage, system limits, data ingested and token quotas.
- D. Organization metrics count towards custom MTS limits.

Answer: A,B,C

Explanation:

The correct answer is A, C, and D. Organization metrics give insights into system usage, system limits, data ingested and token quotas. Organization metrics are included for free. A user can plot and alert on them like metrics they send to Splunk Observability Cloud.

Organization metrics are a set of metrics that Splunk Observability Cloud provides to help you measure your organization's usage of the platform. They include metrics such as:

Ingest metrics: Measure the data you're sending to Infrastructure Monitoring, such as the number of data points you've sent.

App usage metrics: Measure your use of application features, such as the number of dashboards in your organization.

Integration metrics: Measure your use of cloud services integrated with your organization, such as the number of calls to the AWS CloudWatch API.

Resource metrics: Measure your use of resources that you can specify limits for, such as the number of custom metric time series (MTS) you've created¹. Organization metrics are not charged and do not count against any system limits. You can view them in built-in charts on the Organization Overview page or in custom charts using the Metric Finder. You can also create alerts based on organization metrics to monitor your usage and performance¹. To learn more about how to use organization metrics in Splunk Observability Cloud, you can refer to this documentation¹.

NEW QUESTION # 12

A user wants to add a link to an existing dashboard from an alert. When they click the dimension value in the alert message, they are taken to the dashboard keeping the context. How can this be accomplished? (select all that apply)

- A. Add the link to the alert message body.
- B. Add a link to the Runbook URL.
- C. Build a global data link.
- D. Add a link to the field.

Answer: C,D

Explanation:

Explanation

The possible ways to add a link to an existing dashboard from an alert are:

Build a global data link. A global data link is a feature that allows you to create a link from any dimension value in any chart or table to a dashboard of your choice. You can specify the source and target dashboards, the dimension name and value, and the query parameters to pass along. When you click on the dimension value in the alert message, you will be taken to the dashboard with the context preserved1 Add a link to the field. A field link is a feature that allows you to create a link from any field value in any search result or alert message to a dashboard of your choice. You can specify the field name and value, the dashboard name and ID, and the query parameters to pass along. When you click on the field value in the alert message, you will be taken to the dashboard with the context preserved2 Therefore, the correct answer is A and C.

To learn more about how to use global data links and field links in Splunk Observability Cloud, you can refer to these documentations12.

1: <https://docs.splunk.com/Observability/gdi/metrics/charts.html#/Global-data-links> 2:

<https://docs.splunk.com/Observability/gdi/metrics/search.html#/Field-links>

NEW QUESTION # 13

Which of the following can be configured when subscribing to a built-in detector?

- A. Alerts on a dashboard.
- B. Links to a chart.
- C. Outbound notifications.
- D. Alerts on team landing page.

Answer: C

Explanation:

Explanation

According to the web search results1, subscribing to a built-in detector is a way to receive alerts and notifications from Splunk Observability Cloud when certain criteria are met. A built-in detector is a detector that is automatically created and configured by Splunk Observability Cloud based on the data from your integrations, such as AWS, Kubernetes, or OpenTelemetry1. To subscribe to a built-in detector, you need to do the following steps:

Find the built-in detector that you want to subscribe to. You can use the metric finder or the dashboard groups to locate the built-in detectors that are relevant to your data sources1.

Hover over the built-in detector and click the Subscribe button. This will open a dialog box where you can configure your subscription settings1.

Choose an outbound notification channel from the drop-down menu. This is where you can specify how you want to receive the alert notifications from the built-in detector. You can choose from various channels, such as email, Slack, PagerDuty, webhook, and so on2. You can also create a new notification channel by clicking the + icon2.

Enter the notification details for the selected channel. This may include your email address, Slack channel name, PagerDuty service key, webhook URL, and so on2. You can also customize the notification message with variables and markdown formatting2.

Click Save. This will subscribe you to the built-in detector and send you alert notifications through the chosen channel when the detector triggers or clears an alert.

Therefore, option C is correct.

NEW QUESTION # 14

A Software Engineer is troubleshooting an issue with memory utilization in their application. They released a new canary version to production and now want to determine if the average memory usage is lower for requests with the 'canary' version dimension. They've already opened the graph of memory utilization for their service.

How does the engineer see if the new release lowered average memory utilization?

- A. On the chart for plot A, click the Compare Means button. In the window that appears, type 'version1'.
- B. On the chart for plot A, select Add Analytics, then select MeanTransformation. In the window that appears, select 'version' from the Group By field.
- **C. On the chart for plot A, select Add Analytics, then select MeanAggregation. In the window that appears, select 'version' from the Group By field.**
- D. On the chart for plot A, scroll to the end and click Enter Function, then enter 'A/B-1'.

Answer: C

Explanation:

Explanation

The correct answer is C. On the chart for plot A, select Add Analytics, then select MeanAggregation. In the window that appears, select 'version' from the Group By field.

This will create a new plot B that shows the average memory utilization for each version of the application.

The engineer can then compare the values of plot B for the 'canary' and 'stable' versions to see if there is a significant difference.

To learn more about how to use analytics functions in Splunk Observability Cloud, you can refer to this documentation¹.
