## NCP-MCA Reliable Exam Materials, Training NCP-MCA Materials

Our NCP-MCA guide torrent boosts 98-100% passing rate and high hit rate. Our Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) test torrent use the certificated experts and our questions and answers are chosen elaborately and based on the real exam according to the past years' exam papers and the popular trend in the industry. The language of our NCP-MCA study torrent is easy to be understood and the content has simplified the important information. Our product boosts the function to simulate the exam, the timing function and the self-learning and the self-assessment functions to make the learners master the NCP-MCA Guide Torrent easily and in a convenient way. Based on the plenty advantages of our product, you have little possibility to fail in the exam.

## Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q38-Q43):

### NEW QUESTION # 38

An administrator has just noticed that a play is stuck in a suspended state.  
What is possible reason for this issue?

- A. Autopilot was set for Wait for approval for every attempt.
- **B. The playbook was set with a Manual trigger and required being resourced.**
- C. The playbook is in a disabled status.
- D. Autopilot status is set to disabled.

**Answer: B**

Explanation:

When a play is stuck in a suspended state, a common reason is that the playbook was set with a Manual trigger and requires manual intervention to proceed. This can occur if the playbook is designed to pause at a certain step, waiting for an administrator or user to manually approve or provide additional input before continuing.

References:

- \* Nutanix Best Practices for Playbook Automation.

### NEW QUESTION # 39

Refer to the exhibit.

The VM appSAP01dev is a SAP development environment application and it is common to have memory constrained alerts on this VM, but the administrator wants to avoid adding memory to development VMs like this one, since this is normally done for only production VMs.

Which two actions should the administrator take to avoid adding memory to the development VMs? (Choose two.)

- A. Modify the Alert by adding the correct category
- B. Assign the category Environment:Production to the production VMs
- C. Disable the Alert in Prism Central
- D. Assign the category Environment:Development to development VMs

**Answer: A,D**

### NEW QUESTION # 40

What is the correct format for a Self-Service Macro?

- A. {var\_name}
- B. @{var\_name}@
- C. @@{var\_name}@@
- D. [[var\_name]]

**Answer: C**

Explanation:

In Nutanix Self-Service (formerly Calm), Macros are used to reference variables within scripts, task definitions, and configurations. The documented syntax for all macros requires the variable name to be enclosed within double "@" symbols and curly braces.

\* Syntax: @@{variable\_name} @@

\* Usage: This format is used for both user-defined variables (e.g., @@{db\_password} @@) and built-in system macros (e.g., @@{address} @@, @@{calm\_time} @@, @@{calm\_project\_name} @@).

\* Evaluation: When the Self-Service engine executes a task, it parses the string, identifies the pattern @@{...} @@, and substitutes it with the actual value of the variable from the current context before sending the script to the target machine.

### NEW QUESTION # 41

Refer to the exhibit.

Calm encountered the error shown in the exhibit when importing a script that maps a network drive.

Upon further investigation, the Calm administrator was unable to run the script manually on a VM and discovered that elevated permissions were needed.

Which command should the administrator add to the script?

- A. Disable-WSManCredSSP -Role Server -Force
- B. Enable-WSManCredSSP -Role Server
- C. Enable-WSManCredSSP -Role Server -Force
- D. Enable-WSManCredSSP -Role Client

**Answer: D**

Explanation:

The error message indicates that the script failed to authenticate to the remote server using CredSSP. CredSSP is a security mechanism that allows a client to delegate its credentials to a remote server for authentication. To use CredSSP, both the client and the server need to enable it and configure the role and the trusted hosts. The command Enable-WSManCredSSP -Role Client enables CredSSP on the client side and specifies the remote server as a trusted host. This command should be added to the script

before invoking the Invoke-Command cmdlet that runs the script block on the remote server. The other commands are either irrelevant or incorrect for this scenario. Reference: Nutanix Calm: PowerShell Scripts - Read the Docs and Enable-WSManCredSSP (Microsoft.PowerShell.Management) - PowerShell | Microsoft Docs.

#### NEW QUESTION # 42

What two pieces of information can an administrator obtain from Plays? (Choose two.)

- A. Start time and end time of each action
- **B. Execution result status**
- C. CVM IP where the alert was triggered
- **D. Host where the action runs**

**Answer: B,D**

Explanation:

Plays are event-driven automation workflows that can be triggered by alerts, schedules, or manual actions.

They consist of one or more actions that run on specified hosts or clusters. An administrator can obtain the following information from Plays:

\* Host where the action runs: Each action in a Play can be configured to run on a specific host or cluster, or on the host or cluster where the alert was triggered. The administrator can view the host or cluster name for each action in the Play details page.

\* Execution result status: Each action in a Play has an execution result status that indicates whether the action was successful, failed, skipped, or cancelled. The administrator can view the status for each action in the Play details page, as well as the overall status of the Play.

The other options are incorrect because:

\* Start time and end time of each action: Plays do not show the start time and end time of each action, only the duration of the action. The administrator can view the duration for each action in the Play details page, as well as the overall duration of the Play.

\* CVM IP where the alert was triggered: Plays do not show the CVM IP where the alert was triggered, only the host or cluster name where the alert was triggered. The administrator can view the host or cluster name for the alert in the Play details page.
