Candidates who want to be satisfied with the AWS Certified Solutions Architect - Associate (SAA-C03) preparation material before buying can try a free demo. Customers who choose this platform to prepare for the AWS Certified Solutions Architect - Associate (SAA-C03) exam require a high level of satisfaction. For this reason, DumpsTests has a support team that works around the clock to help SAA-C03 applicants find answers to their concerns.

To prepare for the SAA-C03 exam, you should have a good understanding of AWS services and features, as well as hands-on experience designing and deploying AWS solutions. You can take advantage of various study resources, such as AWS training courses, practice exams, and whitepapers, to enhance your knowledge and skills. You can also join online forums and communities to connect with other AWS professionals and share your experiences and insights.

Earning the Amazon SAA-C03 Certification can be a valuable asset for IT professionals who work with AWS. It validates their expertise in designing and deploying scalable and fault-tolerant systems on AWS, which can help them advance their career and increase their earning potential. Additionally, it can help organizations identify professionals who have the necessary skills to deploy and manage AWS solutions effectively.

It's time to expand your knowledge and skills if you're committed to pass the Amazon SAA-C03 Exam and get the certification badge to advance your profession.

Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q159-Q164):

NEW QUESTION # 159
[Design Secure Architectures]
A company runs an application using Amazon ECS. The application creates esi/ed versions of an original image and then makes Amazon S3 API calls to store the resized images in Amazon S3.
How can a solutions architect ensure that the application has permission to access Amazon S3?

- A. Create a security group that allows access from Amazon ECS to Amazon S3, and update the launch configuration used by the ECS cluster.
- B. Update the S3 role in AWS IAM to allow read/write access from Amazon ECS, and then relaunch the container.
- C. Create an IAM role with S3 permissions, and then specify that role as the taskRoleAm in the task definition.
- D. Create an IAM user with S3 permissions, and then relaunch the Amazon EC2 instances for the ECS cluster while logged in as this account.

Answer: C

Explanation:

NEW QUESTION # 160
A company asks a solutions architect to review the architecture for its messaging application. The application uses TCP and UDP traffic. The company is planning to deploy a new VoIP feature, but its 10 test users in other countries are reporting poor call quality. The VoIP application runs on an Amazon EC2 instance with more than enough resources. The HTTP portion of the company's application behind an Application Load Balancer has no issues.
What should the solutions architect recommend for the company to do to address the VoIP performance issues?

- A. Use AWS Global Accelerator.
- B. Migrate from Application Load Balancers to Network Load Balancers.
- C. Use an Amazon Route 53 geoproximity routing policy.
- D. Implement Amazon CloudFront into the architecture.

Answer: A

Explanation:
AWS Global Accelerator is a service that improves global application availability and performance using the AWS global network.
It supports both TCP and UDP protocols and provides optimized routing and lower latency for real-time applications such as VoIP, regardless of where the user is located globally.
AWS Documentation Extract:
"AWS Global Accelerator uses the AWS global network to optimize the path to your application endpoints, improving performance for TCP and UDP traffic, such as VoIP." (Source: AWS Global Accelerator documentation) B: CloudFront accelerates HTTP/S content, not TCP/UDP.
C: Route 53 geoproximity routing is for DNS-based routing, not for traffic acceleration.
D: Network Load Balancers support TCP/UDP, but do not address global latency or provide acceleration.

NEW QUESTION # 161
A company is building a shopping application on AWS. The application offers a catalog that changes once each month and needs to scale with traffic volume. The company wants the lowest possible latency from the application. Data from each user's shopping carl needs to be highly available. User session data must be available even if the user is disconnected and reconnects.
What should a solutions architect do to ensure that the shopping cart data is preserved at all times?

- A. Configure an Application Load Balancer to enable the sticky sessions feature (session affinity) for access to the catalog in Amazon Aurora.
- B. Configure an Amazon EC2 instance with Amazon Elastic Block Store (Amazon EBS) storage for the catalog and shopping cart. Configure automated snapshots.
- C. Configure Amazon OpenSearch Service to cache catalog data from Amazon DynamoDB and shopping cart data from the user's session.
- D. Configure Amazon ElastiCacJie for Redis to cache catalog data from Amazon DynamoDB and shopping carl data from the user's session.

Answer: D

Explanation:
To ensure that the shopping cart data is preserved at all times, a solutions architect should configure Amazon ElastiCache for Redis to cache catalog data from Amazon DynamoDB and shopping cart data from the user's session. This solution has the following benefits:
It offers the lowest possible latency from the application, as ElastiCache for Redis is a blazing fast in-memory data store that provides sub-millisecond latency to power internet-scale real-time applications1.
It scales with traffic volume, as ElastiCache for Redis supports horizontal scaling by adding more nodes or shards to the cluster, and vertical scaling by changing the node type2.
It is highly available, as ElastiCache for Redis supports replication across multiple Availability Zones and automatic failover in case of a primary node failure3.
It preserves user session data even if the user is disconnected and reconnects, as ElastiCache for Redis can store session data, such as user login information and shopping cart contents, in a persistent and durable manner using snapshots or AOF (append-only file) persistence4.

NEW QUESTION # 162
A company has developed a new video game as a web application. The application is in a three-tier architecture in a VPC with Amazon RDS for MySQL in the database layer. Several players will compete concurrently online. The game's developers want to display a top-10 scoreboard in near-real time and offer the ability to stop and restore the game while preserving the current scores. What should a solutions architect do to meet these requirements?

- A. Set up an Amazon ElastiCache for Memcached cluster to cache the scores for the web application to display.
- B. Create a read replica on Amazon RDS for MySQL to run queries to compute the scoreboard and serve the read traffic to the web application.
- C. Place an Amazon CloudFront distribution in front of the web application to cache the scoreboard in a section of the application.
- D. Set up an Amazon ElastiCache for Redis cluster to compute and cache the scores for the web application to display.

Answer: D

Explanation:
This answer is correct because it meets the requirements of displaying a top-10 scoreboard in near-real time and offering the ability to stop and restore the game while preserving the current scores. Amazon ElastiCache for Redis is a blazing fast in-memory data store that provides sub-millisecond latency to power internet-scale real-time applications. You can use Amazon ElastiCache for Redis to set up an ElastiCache for Redis cluster to compute and cache the scores for the web application to display. You can use Redis data structures such as sorted sets and hashes to store and rank the scores of the players, and use Redis commands such as ZRANGE and ZADD to retrieve and update the scores efficiently. You can also use Redis persistence features such as snapshots and append-only files (AOF) to enable point-in-time recovery of your data, which can help you stop and restore the game while preserving the current scores.

NEW QUESTION # 163

A group requires permissions to list an Amazon S3 bucket and delete objects from that bucket An administrator has created the following 1AM policy to provide access to the bucket and applied that policy to the group. The group is not able to delete objects in the bucket. The company follows least-privilege access rules.

A)

B)

C)

- A. Option B
- B. Option D
- C. Option A
- D. Option C

Answer: B

Explanation:
