

JN0-683 Latest Test Answers, JN0-683 Prep Guide

P.S. Free & New JN0-683 dumps are available on Google Drive shared by TestInsides: https://drive.google.com/open?id=1c_AEo94PYMEaUaqT6vIAiKpwc4p91tz7

With TestInsides's Juniper JN0-683 exam training materials, you can get the latest Juniper JN0-683 exam questions and answers. It can make you pass the Juniper JN0-683 exam. Juniper JN0-683 exam certification can help you to develop your career. TestInsides's Juniper JN0-683 Exam Training materials is ensure that you fully understand the questions and issues behind the concept. t can help you pass the exam easily.

In this age of knowledge competition, we must keep up with the pace of the times, otherwise we will be eliminated. How to improve your ability and how to prove your ability is crucial. The answer is JN0-683 Certification can help you prove your strength and increase social competitiveness. Although it is not an easy thing for somebody to pass the exam, but our JN0-683 Exam Torrent can help aggressive people to achieve their goals. This is the reason why we need to recognize the importance of getting the test JN0-683 certification.

JN0-683 Prep Guide - Reliable JN0-683 Exam Cost

One of the best features of Juniper JN0-683 exam dumps is its Data Center, Professional (JNCIP-DC) exam passing a money-back guarantee. Now with TestInsides JN0-683 exam dumps your investment is secured with a money-back guarantee. If you fail in Juniper JN0-683 Exam despite using TestInsides Exam Questions you can claim your paid amount.

Juniper JN0-683 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> VXLAN: This part requires knowledge of VXLAN, particularly how the control plane manages communication between devices, while the data plane handles traffic flow. Demonstrate knowledge of how to configure, Monitor, or Troubleshoot VXLAN.
Topic 2	<ul style="list-style-type: none"> Data Center Deployment and Management: This section assesses the expertise of data center networking professionals like architects and engineers, focusing on key deployment concepts. Topics include Zero-touch provisioning (ZTP), which automates device setup in data centers without manual input.
Topic 3	<ul style="list-style-type: none"> Data Center Multitenancy and Security: This section tests knowledge of single-tenant and multitenant data center setups. Candidates such as Data Center Professionals are evaluated on ensuring tenant traffic isolation at both Layer 2 and Layer 3 levels in shared infrastructure environments.

Topic 4	<ul style="list-style-type: none"> • EVPN-VXLAN Signaling: This section assesses an understanding of Ethernet VPN (EVPN) concepts, including route types, multicast handling, and Multiprotocol BGP (MBGP). It also covers EVPN architectures like CRB and ERB, MAC learning, and symmetric routing.
---------	--

Juniper Data Center, Professional (JNCIP-DC) Sample Questions (Q15-Q20):

NEW QUESTION # 15

Click the Exhibit button. You are troubleshooting an IP fabric for your data center. You notice that your traffic is not being load balancing to your spine devices from leaf devices.

Referring to the configuration shown in the exhibit, what must be configured to solve this issue?

- A. The load-balance policy must have a from statement that matches on protocol bgp.
- B. The load-balance policy must be applied as an export policy to your BGP.
- **C. The load-balance policy must be applied to the forwarding table under the routing-options hierarchy.**
- D. The multipath multiple-as configuration must be configured for each peer in the BGP spine group.

Answer: C

Explanation:

You already have BGP multipath turned on (multiple-as;), so the control plane can install multiple equal-cost routes to the spines.

You also created a load-balance policy (load-balance per-packet;).

But the traffic is still not being balanced → because the policy is not applied anywhere.

In Junos, per-packet (or per-flow) load-balancing is not decided in BGP.

It's decided in the forwarding table (FIB) - the place where the actual packet forwarding happens.

That's why Juniper requires you to "attach" your load-balancing policy to the forwarding table.

NEW QUESTION # 16

Exhibit.

Both DC and DC2 are using EVPN-VXLAN technology deployed using an ERB architecture. A server on the Red VLAN must communicate with a server on the Green VLAN. The Blue VLAN in DC and DC2 needs to be the same VLAN.

Which statement is correct in this scenario?

- A. An interconnect is required between four leaf devices in the services blocks; the Red VLAN and the Green VLAN must be stitched and the Blue VLAN must be stretched.
- **B. An interconnect is required between the four SRX Series devices; the Blue VLAN must be stretched and a transit VNI must be added for the Red and Green VLANs.**
- C. A lean super spine device must be added to DC and DC2; all VLANs must be stretched to the lean super spine device and the lean super spine devices must stitch all the VLANs together.
- D. The eight spine devices must be configured as border spine devices; a full mesh interconnect must exist between all eight spine devices and the Blue VLAN must be stitched together

Answer: B

Explanation:

* ERB Architecture in EVPN-VXLAN:

* ERB (Edge Routed Bridging) architecture is commonly used in data center networks where routing decisions are made at the network edge (leaf or border devices), while bridging (Layer 2 forwarding) is extended across the fabric. This architecture allows for efficient L3 routing while still enabling L2 services like VLANs to span across multiple locations.

* VLAN and VNI Configuration:

* The scenario specifies that a server on the Red VLAN needs to communicate with a server on the Green VLAN. Since these VLANs are in different data centers (DC and DC2), and given the use of EVPN-VXLAN, the communication between these VLANs will require a transit VNI (Virtual Network Identifier). This transit VNI will allow traffic to traverse the VXLAN tunnel across the DCI (Data Center Interconnect).

* Interconnect between SRX Series Devices:

* The exhibit shows SRX Series Chassis Clusters used as service devices (likely for firewalling or other security services). These devices need to be interconnected between the two data centers to ensure that VLANs can communicate effectively. The Blue VLAN needs to be stretched between DC and DC2 to maintain the same Layer 2 domain across both data centers.

Conclusion:

* Option B: Correct- Interconnecting the SRX Series devices will ensure the necessary service chaining, while stretching the Blue VLAN and adding a transit VNI for the Red and Green VLANs will enable the required communication across the data centers.

NEW QUESTION # 17

Exhibit.

□ Connections between hosts connected to Leaf-1 and Leaf-2 are not working correctly.

- A. Configure the set switch-options service-id 1 parameter on Leaf-2.
- **B. Configure the set switch-options vrf-target target:65000:1 parameter on Leaf-2.**
- C. Referring to the exhibit, which two configuration changes are required to solve the problem? (Choose two.)
- **D. Configure the set switch-options route-distinguisher i92.168.100.50:1 parameter on Leaf-1.**
- E. Configure the set switch-options vtep-source-interface irb.0 parameter on Leaf-1.

Answer: B,D

NEW QUESTION # 18

You manage an IP fabric with an EVPN-VXLAN overlay. You have multiple tenants separated using multiple unique VRF instances. You want to determine the routing information that belongs in each routing instance's routing table.

In this scenario, which property is used for this purpose?

- A. the VRF table label
- B. the VRF target community
- **C. the route distinguisher value**
- D. the routing instance type

Answer: C

Explanation:

In an EVPN-VXLAN overlay, the route distinguisher (RD) is used to uniquely identify routes in different VRFs (Virtual Routing and Forwarding instances). The RD allows the same IP address to be used in different VRFs, making sure the routing information for each tenant is separated.

The RD value ensures that each routing instance (or VRF) has its own unique address space and routing table entries.

NEW QUESTION # 19

You are asked for TX and RX traffic statistics for each interface to which an application server is attached. The statistics need to be reported every five seconds. Using the Junos default settings, which telemetry method would accomplish this request?

- A. gNMI
- **B. Native Sensors**
- C. SNMP
- D. OpenConfig

Answer: B

Explanation:

Native Sensors: Junos provides "Native Sensors" as part of its telemetry capabilities, which can be used to gather interface statistics like TX (transmit) and RX (receive) traffic. With the default configuration, native sensors can be configured to report traffic statistics at a specified interval, such as every five seconds, making this the correct method to fulfill the requirement for periodic traffic reporting.

NEW QUESTION # 20

.....

Under the hatchet of fast-paced development, we must always be cognizant of social long term goals and the direction of the development of science and technology. Adapt to the network society, otherwise, we will take the risk of being obsoleted. Our

JN0-683 Test Torrent keep a look out for new ways to help you approach challenges and succeed in passing the Data Center, Professional (JNCIP-DC) exam. An ancient Chinese proverb states that “The journey of a thousand miles starts with a single step”. To be recognized as the leading international exam bank in the world through our excellent performance, our Data Center, Professional (JNCIP-DC) qualification test are being concentrated on for a long time and have accumulated mass resources and experience in designing study materials.
