Valid Dumps ACA-100 Book & Simulated ACA-100 Test

Are you worried about insufficient time to prepare the exam? Do you have a scientific learning plan? Maybe you have set a series of

to-do list, but it's hard to put into practice for there are always unexpected changes during the ACA-100 exam. Here we recommend our ACA-100 test prep to you. With innovative science and technology, our study materials have grown into a powerful and favorable product that brings great benefits to all customers. We are committed to designing a kind of scientific study material to balance your business and study schedule. With our ACA-100 Exam Guide, all your learning process includes 20-30 hours. As long as you spare one or two hours a day to study with our latest ACA-100 quiz prep, we assure that you will have a good command of the relevant knowledge before taking the exam. What you need to do is to follow the ACA-100 exam guide system at the pace you prefer as well as keep learning step by step.

Appian Certified Analyst Sample Questions (Q46-Q51):

NEW QUESTION # 46

Which BPMN notation type is used to reflect the roles and associated activities within a Process Model diagram?

- A. Sub-Process
- B. Sequence Flow
- **C. Swimlane**
- D. Task

Answer: C

Explanation:

In BPMN (Business Process Model and Notation), a swimlane is used to represent roles and their associated activities within a process model diagram. Each swimlane represents a different role or department, and the tasks or activities performed by that role are placed within the corresponding swimlane. This visual distinction helps in understanding who is responsible for which parts of the process.

Swimlane Overview:

Swimlanes are horizontal or vertical sections within a process model diagram.

Each lane is labeled with the name of the role, department, or entity that is responsible for the activities within that lane.

The activities (tasks, events, gateways) are placed within the appropriate swimlane to show which role is performing each action.

Why Not Other Options?:

A . Task: Represents a single unit of work or activity but does not indicate the role responsible for it.

C . Sequence Flow: Represents the order of activities but does not relate to roles or responsibilities.

D . Sub-Process: Represents a group of related tasks but, again, does not indicate which role is responsible for the activities.

References:

Appian Documentation on Process Modeling: Process Models

Swimlanes are essential for clarifying responsibilities in a process, making it easier for stakeholders to understand and manage the process.

NEW QUESTION # 47

Review the following project phase definition:

"A standardized agreement between Development Team and the Product Owner on what criteria a user story must meet in order for the team to consider it complete." Which option does this definition apply to?

- A. Definition of Ready (DoR)
- B. Value Statement
- C. Acceptance Criteria
- **D. Definition of Done (DoD)**

Answer: D

Explanation:

The "Definition of Done" (DoD) refers to a shared understanding between the Development Team and the Product Owner on the criteria that a user story must meet to be considered complete. This definition helps ensure that all aspects of the user story are fully developed, tested, and meet the agreed-upon standards before being marked as done.

Definition of Done Overview:

DoD includes all conditions that must be satisfied for the work to be accepted by the product owner.

It typically covers code completion, testing, documentation, and any other activities required to deliver a finished product.

Why Not Other Options?:

A . Acceptance Criteria: Defines specific requirements that a user story must meet, but does not encapsulate the broader checklist for completion.

B . Value Statement: Describes the value delivered by a feature, not the criteria for completion.

C . Definition of Ready (DoR): Refers to when a user story is ready to be taken into a sprint, not when it is complete.

References:

Appian Community Success Guide: Definition of Done in Agile Projects

The Definition of Done ensures that the product increment is fully functional, tested, and ready for deployment, maintaining a high standard of quality.

NEW QUESTION # 48

A given user story has a description and an acceptance criterion.

Which two other things are needed to mark the story as ready?

- A. Priority
- B. Sprint number
- C. Estimation
- D. Developer assignment

Answer: A,C

NEW QUESTION # 49

Of the choices provided, which are the three most appropriate use cases for Appian?

- A. The customer needs to perform large-scale extract, transform, and load (ETL) operations
- B. The customer needs to have one site tab for each of their seven personas
- C. The customer needs to be able to run their application in a browser
- D. The customer needs to be able to embed the application within their own web page
- E. The customer needs to be able to run their application on mobile devices

Answer: B,C,E

Explanation:

Appian is a low-code platform designed for building enterprise applications with a focus on flexibility, user experience, and integration capabilities. The most appropriate use cases for Appian include:

Mobile Compatibility (B):

Appian supports mobile-first design, allowing applications to be easily accessed and used on mobile devices without requiring separate development efforts.

This capability is critical for businesses that need their workforce to access applications on the go.

Multiple Site Tabs for Personas (C):

Appian allows for the creation of different site tabs for different user personas, each with a tailored user experience.

This is ideal for organizations with distinct user groups who need customized interfaces and access to specific parts of the application.

Browser-Based Application (D):

Appian applications are web-based and can be accessed directly from a browser, ensuring easy access and a consistent user experience across different platforms.

Why Not Other Options?:

A . Large-Scale ETL Operations: Appian is not primarily designed for heavy data extraction, transformation, and loading (ETL) tasks, which are typically handled by specialized ETL tools.

E . Embedding in Web Pages: While Appian allows for embedding certain components, it is not the primary focus or strength of the platform compared to full-featured applications.

NEW QUESTION # 50

An organization wants to automate identification of its dissatisfied customers based on the ticket description and assign the appropriate team to provide a quick resolution.

What is the best way to auto-classify the dissatisfied customers as part of processing?

- A. Using a SAIL form
- **B. Using a natural language connected system**
- C. Using a decision table
- D. Using an image analysis connected system

Answer: B

Explanation:

The organization aims to automate the identification of dissatisfied customers based on the ticket description. To achieve this, leveraging natural language processing (NLP) capabilities is the most efficient method. Appian provides connected systems that allow integration with external NLP services. These services can analyze text data (such as ticket descriptions) to determine the sentiment or classify the text into predefined categories (like "dissatisfied customer").

Natural Language Connected System:

Appian can integrate with third-party NLP platforms such as Google Cloud Natural Language, AWS Comprehend, or Azure Text Analytics via connected systems.

These services analyze the text provided in the ticket description to detect sentiment, keywords, or specific categories indicating dissatisfaction.

Based on the analysis, the system can automatically assign the appropriate team to handle the case.

Why Not Other Options?:

B . Decision Table: While decision tables are useful for rule-based decisions, they are not suitable for interpreting unstructured text like ticket descriptions.

C . Image Analysis Connected System: This option is irrelevant as the task involves text processing, not image analysis.

D . SAIL Form: SAIL forms are primarily used for user interface creation and are not intended for text analysis or classification.

Implementation in Appian:

Create a connected system to integrate with the chosen NLP service.

Configure the NLP service to analyze the text data and return the sentiment or classification results.

Based on the results, use process models to route the ticket to the appropriate team for resolution.
