Palo Alto Networks Cloud Security Professional Sample Questions (Q177-Q182):

NEW QUESTION # 177

Which policy type in Prisma Cloud can protect against malware?

- A. Event
- **B. Data**
- C. Config
- D. Network

Answer: B

Explanation:

Reference: <https://docs.paloaltonetworks.com/prisma/prisma-cloud/prisma-cloud-admin/prisma-cloud-policies/create-a-policy.html#:~:text=%E2%80%94Data%20policies%20protect%20against%20malware,for%20Data%20Exposure%20or%20Malware>

The Data policy type in Prisma Cloud is designed to protect against malware by scanning data and files for malicious content. This policy type helps in identifying and mitigating malware threats in the cloud environment.

NEW QUESTION # 178

Under which tactic is "Exploit Public-Facing Application" categorized in the ATT&CK framework?

- A. Privilege Escalation
- B. Execution
- **C. Initial Access**
- D. Defense Evasion

Answer: C

Explanation:

In the MITRE ATT&CK framework, the tactic "Exploit Public-Facing Application" is categorized under Initial Access. This tactic involves leveraging vulnerabilities in public-facing applications to gain unauthorized access to an organization's external services or applications. Initial Access tactics are concerned with the methods adversaries use to gain an initial foothold within a network, and exploiting public-facing applications is a common approach used by attackers to breach external defenses and establish a presence within a target network.

NEW QUESTION # 179

Which of the following is not a supported external integration for receiving Prisma Cloud Code Security notifications?

- A. Microsoft Teams
- B. Cortex XSOAR
- C. Splunk
- **D. ServiceNow**

Answer: D

Explanation:

Prisma Cloud enables you to send notifications for new code and CI/CD security issues detected during periodic scans of your environments to messaging systems that you have integrated with Prisma Cloud.

Supported messaging systems include Microsoft Teams, Slack, Splunk, JIRA, ServiceNow notification systems, as well as for webhooks.

NEW QUESTION # 180

A Prisma Cloud Administrator needs to enable a Registry Scanning for a registry that stores Windows images.

Which of the following statement is correct regarding this process?

- A. A defender is not required to configure this type of registry scan.
- B. There are Windows host defenders deployed in your environment already. Therefore, they do not need to deploy any additional defenders.
- C. There are Windows host defenders deployed in your environment already.
- D. They can deploy any type of container defender to scan this registry.

Answer: C

Explanation:

When enabling Registry Scanning in Prisma Cloud for a registry that stores Windows images, it's important to note that Windows host defenders must be deployed in the environment to scan these images effectively. The Windows host defenders are specialized versions of the Prisma Cloud Defender that are designed to run on Windows operating systems. They provide the necessary functionality to scan Windows container images stored in registries, identifying vulnerabilities and ensuring the images comply with security policies before they are deployed. This requirement underscores the importance of having the appropriate Defender deployments that match the operating systems of the images being scanned.

NEW QUESTION # 181

What is the primary purpose of Prisma Cloud Code Security?

- A. To offer instant feedback on application performance issues and bottlenecks
- B. To provide a platform for developers to create custom security policies for applications
- C. To triage alerts and incidents in realtime during deployment
- D. To address cloud infrastructure misconfigurations in code before they become alerts or incidents

Answer: D

Explanation:

Prisma Cloud Code Security is designed to integrate security into the DevOps process by scanning infrastructure as code (IaC) templates and configurations for potential security issues. This proactive approach allows developers and security teams to address misconfigurations and vulnerabilities in the code itself, before they are deployed into the cloud environment and become more challenging to resolve. By identifying and rectifying these issues early in the development lifecycle, organizations can reduce the risk of alerts and incidents arising from misconfigurations in their cloud infrastructure, leading to a more secure and compliant cloud environment.
