Scaled Agile SAFe Release Train Engineer Sample Questions (Q145-Q150):

NEW QUESTION # 145

Who commits to the Iteration goals at the end of Iteration planning?

- A. The team
- B. The Solution Owner
- C. The Product Owner
- D. The Scrum Master

Answer: A

Explanation:

Iteration goals are a high-level summary of the business and technical goals that the Agile Team agrees to accomplish in an Iteration. As described in the Iteration Planning article on the SAFe website, the planning process produces a set of committed iteration goals. These goals are agreed upon by the Agile Team, which aligns team members to a common purpose and aligns teams to common Program Increment (PI) Objectives. It is the Agile Team that commits to the iteration goals, providing transparency and management information, and ensuring alignment and the ability to make necessary adjustments during the execution of the Planning Interval.

NEW QUESTION # 146

An Agile Release Train (ART) is frequently discovering compatibility issues between the developed Solution and the Enterprise information architecture. What can the Release Train Engineer do to prevent this from occurring?

- A. Add data Architects onto the ART
- B. Develop more detailed Feature definitions
- C. Confirm attendance of architectural representatives at Program Increment (PI) Planning
- D. Conduct the entire data architecture design upfront

Answer: C

Explanation:

To prevent compatibility issues between the developed Solution and the Enterprise information architecture, the Release Train Engineer (RTE) can take proactive steps during the Program Increment (PI) Planning phase.

One effective approach is to ensure that architectural representatives are present at PI Planning meetings. This allows for early detection and resolution of potential compatibility issues, as these representatives can provide valuable insights into the Enterprise information architecture and how the developed Solution should align with it.

By confirming the attendance of architectural representatives, the RTE facilitates direct communication between the development teams and the architects. This collaboration is crucial for aligning the ART's work with the broader architectural standards and requirements, thereby reducing the likelihood of encountering compatibility issues later in the development process.

This strategy aligns with the SAFe principle of fostering collaboration and alignment across various roles within the ART to ensure a smooth and efficient workflow that adheres to the organization's technical and strategic objectives¹.

NEW QUESTION # 147

Which two practices are most important for the Agile Release Train to best support Re-lease on Demand?
(Choose two.)

- A. Continuous Integration
- B. Change board community of practice
- C. Decouple deployment from release
- D. Centralized risk management
- E. Aligning around organizational value streams

Answer: A,C

Explanation:

The Agile Release Train (ART) supports Release on Demand by ensuring that new functionality can be released to the end users at a moment's notice, which is a critical aspect of the Continuous Delivery Pipeline.

This is achieved through two key practices:

* Decouple deployment from release : This practice allows for the deployment of new functionality into production without making it immediately visible to end users. It provides the flexibility to release features incrementally based on business needs, rather than being tied to the deployment schedule¹.

* Continuous Integration (E): Continuous Integration is a software development practice where developers regularly merge their code changes into a central repository, after which automated builds and tests are run. The key benefits of Continuous Integration include the ability to detect and fix integration issues early, leading to more reliable software and faster development cycles. This practice is fundamental to supporting Release on Demand because it ensures that the software is always in a releasable state, which is essential for the quick release of new features¹.

These practices are part of the larger framework of SAFe, which emphasizes the importance of ARTs being able to deliver value efficiently and effectively to meet customer and business needs.

NEW QUESTION # 148

Which statement is true about teams?

- A. Teams are more productive than the same number of individuals
- B. Agile Teams can manage daily interruptions
- C. Products are more robust when individuals on teams have specific skill sets

- D. Changes in team composition do not impact productivity

Answer: A

Explanation:

The SAFe framework emphasizes the importance of teams over individuals in terms of productivity.

According to SAFe, Agile teams are cross-functional groups that have all the skills necessary to define, build, test, and where applicable, deploy value in short, sustainable bursts of work. This cross-functionality and collaboration enable teams to be more productive and deliver value more effectively than individuals working separately. The Release Train Engineer (RTE) role within SAFe is designed to support these teams by facilitating ART events and processes, helping manage risks, and driving relentless improvement, which further enhances team productivity¹.

NEW QUESTION # 149

Which primary role should emphasize lifelong learning?

- A. Lean-Agile Leaders
- B. Business Owners
- C. Product Management
- D. Scrum Masters

Answer: A
