Salesforce Order Management Administrator Accredited Professional 認定 AP-219 試験問題 (Q107-Q112):

質問 # 107

Universal Containers (UC) has a flow which performs some custom logic in order to determine a least-cost shipping location. Some of the variables should be reset at the beginning of each loop iteration. Which design element in Flow allows the Admin to do this?

- A. Reset
- B. Preset
- C. Reassignment
- **D. Assignment**

正解: D

解説:

The design element in Flow that allows the admin to reset some variables at the beginning of each loop iteration is Assignment. An Assignment element lets the admin assign new values to one or more variables or sObject fields in a flow. The admin can use an Assignment element before a Loop element to initialize the variables that are used in the loop, and then use another Assignment element inside the loop to reset the variables for each iteration. 正解: C

質問 # 109

Which three steps should an administrator take to set up a mock payment gateway in a new org?

- A. Create a CORS (Cross-Origin Resource Sharing) entry
- **B. Create a Named Credential**
- C. Create a Trusted Site Entry
- **D. Create a Payment Provider**
- **E. Create a Payment Gateway**

正解: B、D、E

解説:

To set up a mock payment gateway in a new org, an administrator should take the following steps:

Create a Payment Provider: This is a custom metadata type that defines the configuration and behavior of a payment gateway. A payment provider specifies the name, type, class, and endpoint of the payment gateway.

Create a Named Credential: This is a Salesforce feature that securely stores authentication information for connecting to external services. A named credential specifies the URL, identity type, authentication protocol, and certificate of the payment gateway.

Create a Payment Gateway: This is a custom object that represents an instance of a payment provider. A payment gateway references a payment provider and a named credential, and defines additional settings such as currency, mode, and timeout.

質問 # 110

What type of relationship exists between FulfillmentOrder and Order Delivery Method?

- A. Master-Detail (Order Delivery Method)
- B. Junction (Many to Many)
- **C. Lookup (Order Delivery Method)**
- D. One-to-One Lookup (Location) FulfillmentFrom LocationId

正解: C

The type of relationship that exists between FulfillmentOrder and Order Delivery Method is Lookup (OrderDelivery Method). A Lookup field is a type of custom field that creates a relationship between two objects, but does not support rollup summary fields. In this case, a FulfillmentOrder has a Lookup field named Order Delivery Method that references an Order Delivery Method record. An Order Delivery Method is a record that represents a delivery option for fulfilling orders, such as standard shipping, express shipping, in-store pickup, etc. An Order Delivery Method can have many FulfillmentOrders associated with it, but a FulfillmentOrder can only have one Order Delivery Method.
