## Cisco Designing Cisco Security Infrastructure Sample Questions (Q63-Q68):

### NEW QUESTION # 63

A financial company is in the process of upgrading network access across the entire company.

The solution must ensure:

- least privilege access
- control access across different network segments
- increased security for employers

Which solution approach must the company take?

- A. SNMP
- B. PKI
- C. NetFlow
- D. RBAC

**Answer: D**

Explanation:

Role-Based Access Control (RBAC) enforces least privilege access by granting permissions based on roles, not individuals. It also

provides centralized control across network segments, ensuring employees only have the access necessary for their responsibilities, thereby increasing overall security.

#### NEW QUESTION # 64

A restaurant distribution center recently suffered a password spray attack targeting the Cisco Secure Firepower Threat Defense VPN headend. The attack attempts to gain unauthorized access by trying common passwords across many accounts. The attack poses a significant security threat to the organization's remote access infrastructure. To enhance the security of VPN setup and minimize the risk of similar attacks in the future, the IT security team must implement effective mitigation measures. Which technique effectively reduces the risk of this type of attack?

- A. Disable group aliases in the connection profiles.
- B. Change the AAA authentication method from RADIUS to TACACS+.
- C. Implement an access list to block addresses from the previous password spray attack.
- D. **Enable AAA authentication for the DefaultWEBVPN and DefaultRAGroup Connection Profiles.**

#### Answer: D

Explanation:

Enabling AAA authentication on the default connection profiles ensures that all VPN access attempts must go through strong authentication. This directly mitigates password spray attacks by enforcing centralized authentication controls, enabling account lockout, and supporting additional protections such as multifactor authentication.

#### NEW QUESTION # 65

Which financial reporting regulatory framework must a publicly traded company doing business in the US comply with?

- A. SOX
- B. HIPAA
- C. FEDRAMP
- D. SOC

#### Answer: A

Explanation:

Publicly traded companies in the United States must comply with the Sarbanes-Oxley Act (SOX). This regulation mandates strict standards for financial reporting, internal controls, and data integrity to protect investors from fraudulent financial practices.

#### NEW QUESTION # 66

A developer is building new API functions for a cloud-based application. Before writing the code, the developer wants to ensure that destructive actions, including deleting and updating data, are properly protected by access control identifying sensitive fields such as those that contain passwords or personally identifiable information. Which approach must be used to score the risks proactively?

- A. SBOM Generation
- B. CSPM
- C. **Open API Specification Analysis**
- D. SAST

#### Answer: C

Explanation:

Open API Specification Analysis evaluates API definitions before code is written, identifying risky endpoints (such as delete or update functions) and sensitive fields (like PII or passwords). This allows developers to proactively score risks and apply proper access controls early in the design phase.

#### NEW QUESTION # 67

A product manager is focused on maintaining the security integrity of a microservice-based application as new features are

developed and integrated. To ensure that known software vulnerabilities are not introduced into the product, it is crucial to implement a robust application security technique. The technique must be applied during the build phase of the software development lifecycle, which allows the team to proactively identify and address vulnerability risks before deployment. Which application security technique must be applied to accomplish the goal?

- A. Open API specification analysis
- B. infrastructure as code scanning
- C. secret detection
- **D. container scanning**

**Answer: D**

Explanation:

Container scanning during the build phase ensures that no known software vulnerabilities are introduced into the application. It scans container images for outdated libraries, misconfigurations, and security flaws before deployment, allowing proactive remediation. This directly supports maintaining the security integrity of a microservice-based application.
