Latest Terraform-Associate-003 Test Materials | Terraform-Associate-003 PDF

Although the pass rate of our Terraform-Associate-003 study materials can be said to be the best compared with that of other exam tests, our experts all are never satisfied with the current results because they know the truth that only through steady progress can

our Terraform-Associate-003 Preparation braindumps win a place in the field of exam question making forever. Therefore, buying our Terraform-Associate-003 actual study guide will surprise you with high grades and you are more likely to get the certification easily.

HashiCorp Terraform-Associate-003 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Develop collaborative Terraform workflows: In this section, candidates are tested for their skills related to managing the Terraform binary, providers, and modules using version constraints and setting up remote states. It also covers the utilization of the Terraform workflow in automation.
Topic 2	<ul style="list-style-type: none">Collaborate on infrastructure as code using HCP Terraform: In this section, the topics covered include analyzing the HCP Terraform run workflow, the role of HCP Terraform workspaces and their configuration options, and the management of provider credentials in HCP Terraform.
Topic 3	<ul style="list-style-type: none">Configure and use Terraform providers: In this section, topics covered include understanding Terraform's plugin-based architecture and configuring providers. It also covers aliasing, sourcing, and versioning functions.
Topic 4	<ul style="list-style-type: none">Create, maintain, and use Terraform modules: In this section of the exam, candidates are tested for creating a module, using a module in configuration, and topics such as refactoring an existing configuration into modules.

HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q249-Q254):

NEW QUESTION # 249

A resource block is shown in the Exhibit section of this page. How would you reference the attribute name of this resource in HCL?

- A. resource.kubernetes_namespace.example.name
- B. kubernetes_namespace.test.name
- C. data.kubernetes.namespace.name
- D. kubernetes_namespace.example.name**

Answer: D

Explanation:

In Terraform, the correct way to reference a resource attribute is:

pgsql

CopyEdit

resource_type.resource_name.attribute

For example, if the resource block is:

hcl

CopyEdit

```
resource "kubernetes_namespace" "example" {
```

```
  metadata {
```

```
    name = "my-namespace"
```

```
}
```

```
}
```

To reference the name attribute, use:

pgsql

CopyEdit

kubernetes_namespace.example.name

Explanation of incorrect answers:

A (resource.kubernetes_namespace.example.name)- Incorrect. Terraform does not use the resource. prefix when referencing resources.

C (data.kubernetes.namespace.name)- Incorrect. This syntax is used for data sources, not resources.

D (kubernetes_namespace.test.name)- Incorrect. The resource name is "example", not "test".

NEW QUESTION # 250

HashiCorp Configuration Language (HCL) supports user-defined functions.

- A. True
- B. False

Answer: B

Explanation:

HashiCorp Configuration Language (HCL) does not support user-defined functions. You can only use the built-in functions that are provided by the language. The built-in functions allow you to perform various operations and transformations on values within expressions. The general syntax for function calls is a function name followed by comma-separated arguments in parentheses, such as `max(5, 12, 9)`. You can find the documentation for all of the available built-in functions in the Terraform Registry or the Packer Documentation, depending on which tool you are using. References = [: Functions - Configuration Language | Terraform](#) [: Functions - Configuration Language | Packer](#)

NEW QUESTION # 251

Which of these commands makes your code more human readable?

- A. Terraform output
- B. Terraform show
- C. Terraform validate
- D. **Terraform fmt**

Answer: D

Explanation:

The command that makes your code more human readable is `terraform fmt`. This command is used to rewrite Terraform configuration files to a canonical format and style, following the Terraform language style conventions and other minor adjustments for readability. The command is optional, opinionated, and has no customization options, but it is recommended to ensure consistency of style across different Terraform codebases. Consistency can help your team understand the code more quickly and easily, making the use of `terraform fmt` very important. You can run this command on your configuration files before committing them to source control or as part of your CI/CD pipeline. Reference = [: Command: fmt : Using Terraform fmt Command to Format Your Terraform Code](#)

NEW QUESTION # 252

Which of the following is true about `terraform apply`? (Pick 2 correct responses)

- A. You cannot target specific resources for the operation.
- B. You must pass the output of a `terraform plan` command to it.
- C. **It only operates on infrastructure defined in the current working directory or workspace.**
- D. **Depending on provider specification, Terraform may need to destroy and recreate your infrastructure resources.**
- E. By default, it does not refresh your state file to reflect the current infrastructure configuration.

Answer: C,D

Explanation:

Comprehensive and Detailed in-Depth Explanation:

* C (#Correct)- If changes require a resource replacement (e.g., changing an immutable attribute like instance type), Terraform will destroy and recreate the resource.

* E (#Correct)- Terraform only applies the configuration in the current directory or workspace.

NEW QUESTION # 253

You have never used Terraform before and would like to test it out using a shared team account for a cloud provider. The shared team account already contains 15 virtual machines (VM). You develop a Terraform configuration containing one VM, perform terraform apply, and see that your VM was created successfully.

What should you do to delete the newly-created VM with Terraform?

- A. Delete the Terraform state file and execute terraform apply.
- B. The Terraform state file contains all 16 VMs in the team account. Execute terraform destroy and select the newly-created VM.
- **C. The Terraform state file only contains the one new VM. Execute terraform destroy.**
- D. Delete the VM using the cloud provider console and terraform apply to apply the changes to the Terraform state file.

Answer: C

Explanation:

This is the best way to delete the newly-created VM with Terraform, as it will only affect the resource that was created by your configuration and state file. The other options are either incorrect or inefficient.

NEW QUESTION # 254

.....

Our Terraform-Associate-003 test questions can help you have a good preparation for exam effectively. Also you don't need to worry about if our Terraform-Associate-003 study materials are out of validity.
