The ISC CISSP practice material for Exams. Choice are essential for your successful learning. Often applicants for the exam run on a tight daily schedule before the final ISC CISSP Exam, so actual Certified Information Systems Security Professional (CISSP) exam questions are fruitful to prepare successfully on the first try.

The CISSP exam is a computer-based test that consists of 250 multiple-choice questions. Candidates have six hours to complete the exam, and they must achieve a passing score of 700 out of 1000 points. CISSP exam is designed to test the candidate's knowledge and understanding of information security concepts, principles, and practices.

Levels of CISSP Certification:

There are four levels of CISSP certification. These levels are Professional Certified Security Analyst, Associate Certified Security Analyst, Certified Information Systems Security Professional (CISSP), and the highest level Master Certified Information Systems Security Professional (MCISSP). The professional level requires passing six exams to achieve, while associate requires six exams to achieve. The Associate-level exam is an objective test that candidates can take online or skype, while professional exam candidates only have access to one option. The CISSP exam tests for knowledge of concepts such as network security, software security, cryptography, physical security, and general security principles. **CISSP Dumps** will help in prep by providing practice exams. Candidates must pass a rigorous 8-hour long exam and demonstrate proficiency in at least 10 out of 12 knowledge areas.

Candidates take the test at their own expense and will be unable to view their results until the end of the testing period. In order to be considered for a certification or renewal, at least two years must have lapsed since the previous exam date. CISSP Certification holders must recertify every three years through continuing education in order to maintain certification. To receive continuing education credit, candidates must maintain a current membership within one of the following organizations: AICPA, CISSP CertVerify, ISACA, ISSA, ISC2 Security Forum, ISSA-Minnesota Chapter/IT Audit & Control Association (ITACA), NACHA-The Electronic Payments Association.

To recertify at the Professional level of certification one must earn 60 CEUs. To recertify at the Associate level of certification one must earn 40 CEUs. Candidates are able to earn up to four continuing education units for each exam. Candidates can earn up to 16 continuing education units through their participation in the IT Security Resources Community of Interest (CIOI).

ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q940-Q945):

NEW QUESTION # 940

From an asset security perspective, what is the BEST countermeasure to prevent data theft due to data remanence when a sensitive data storage media is no longer needed?

- A. Return the media to the system owner.
- B. Encrypt data before it is stored on the media.
- C. Physically destroy the retired media.
- D. Delete the sensitive data from the media.

Answer: C

Explanation:

From an asset security perspective, the best countermeasure to prevent data theft due to data remanence when a sensitive data storage media is no longer needed is to physically destroy the retired media. Data remanence is the residual data that remains on a storage device after it has been erased or formatted. Data remanence poses a risk of unauthorized disclosure or recovery of sensitive information by malicious actors. Physical destruction is the most secure method of eliminating data remanence, as it involves rendering the storage media unusable and irreparable by methods such as shredding, pulverizing, burning, or melting. Physical destruction ensures that no data can be retrieved from the media, even with advanced forensic tools or techniques.

NEW QUESTION # 941

An organization wants to share data securely with their partners via the Internet. Which standard port is typically used to meet this requirement?

- A. Setup a server on User Datagram Protocol (UDP) port 69
- B. Setup a server on Transmission Control Protocol (TCP) port 21
- C. Setup a server on Transmission Control Protocol (TCP) port 80
- D. Setup a server on Transmission Control Protocol (TCP) port 22

Answer: D

Explanation:

The standard port that is typically used to share data securely with partners via the Internet is Transmission Control Protocol (TCP) port 22. TCP port 22 is the default port for Secure Shell (SSH), a protocol that provides encrypted and authenticated communication between systems over an unsecured network. SSH can be used to securely transfer files, execute commands, or tunnel other protocols. SSH uses public key cryptography to authenticate the systems and users, and symmetric cryptography to encrypt the data. SSH can also compress the data to reduce the bandwidth usage and improve the performance. SSH is widely used for remote administration, file transfer, and network management.

NEW QUESTION # 942

Java is not:

- A. Multithreaded.
- B. Distributed.
- C. Architecture Specific.
- D. Object-oriented.

Answer: C

Explanation:

JAVA was developed so that the same program could be executed on multiple hardware and operating system platforms, it is not Architecture Specific.

The following answers are incorrect:

Object-oriented. Is not correct because JAVA is object-oriented. It should use the object-oriented programming methodology.
Distributed. Is incorrect because JAVA was developed to be able to be distributed, run on multiple computer systems over a network.

Multithreaded. Is incorrect because JAVA is multi-threaded that is calls to subroutines as is the case with object-oriented programming.

NEW QUESTION # 943

Which of the following is the MOST common method of memory protection?

- A. Virtual Local Area Network (VLAN) tagging
- B. Compartmentalization
- C. Error correction
- **D. Segmentation**

Answer: D

Explanation:

The most common method of memory protection is segmentation. Segmentation is a technique that divides the memory space into logical segments, such as code, data, stack, and heap. Each segment has its own attributes, such as size, location, access rights, and protection level. Segmentation can help to isolate and protect the memory segments from unauthorized or unintended access, modification, or execution, as well as to prevent memory corruption, overflow, or leakage. Compartmentalization, error correction, and VLAN tagging are not methods of memory protection, but of information protection, data protection, and network protection, respectively. NEW QUESTION # 944

Which ISO/OSI layer establishes the communications link between individual devices over a physical link or channel?

- A. Transport layer
- B. Network layer
- **C. Data link layer**
- D. Physical layer

Answer: C

Explanation:

The data link layer (layer 2) establishes the communications link between individual devices over a physical link or channel. It also ensures that messages are delivered to the proper device and translates the messages from layers above into bits for the physical layer (layer 1) to transmit.
