We emphasize on customers satisfaction, which benefits both exam candidates and our company equally. By developing and nurturing superior customers value, our company has been getting and growing more and more customers. To satisfy the goals of exam candidates, we created the high quality and high accuracy Managing-Cloud-Security real materials for you. By experts who diligently work to improve our practice materials over ten years, all content are precise and useful and we make necessary alternations at intervals.

### WGU Managing Cloud Security (JY02) Sample Questions (Q41-Q46):

#### NEW QUESTION # 41

During a financial data investigation, the investigator is unsure how to handle a specific data set. Which set of documentation should they refer to for detailed steps on how to proceed?

- A. Policies
- **B. Procedures**
- C. Legal rulings
- D. Legal definitions

**Answer: B**

Explanation:

Procedures are detailed, step-by-step instructions that guide personnel on how to perform specific tasks in alignment with higher-level policies. In an investigation, when uncertainty arises about handling a dataset, procedures provide the exact operational guidance required.

Policies establish high-level rules (e.g., "financial data must be protected"), while procedures explain how to achieve compliance with those policies (e.g., "verify encryption, label dataset, log access, and escalate to compliance officer"). Legal rulings and definitions are external references but do not provide operational steps.

By following documented procedures, investigators ensure consistency, compliance, and defensibility in legal contexts. This also ensures that evidence is handled properly, supporting admissibility in court and protecting the organization against legal or regulatory challenges.

#### NEW QUESTION # 42

A customer service representative needs to verify a customer's private information, but the representative does not need to see all the information. Which technique should the service provider use to protect the privacy of the customer?

- A. Masking
- B. Hashing
- C. Tokenization
- D. Encryption

**Answer: A**

Explanation:

Data masking is a privacy-preserving technique that replaces sensitive fields with obfuscated or partial values while retaining usability. For example, displaying only the last four digits of a Social Security Number or credit card number. This allows a representative to verify identity without accessing the full data set.

Hashing and encryption protect data at rest or in transit, but they do not allow selective partial display.

Tokenization substitutes sensitive data with unique tokens but is typically used for storage and processing rather than interactive verification. Masking, on the other hand, is specifically designed for scenarios where a user must work with limited but recognizable data.

By using masking, organizations enforce the principle of least privilege, reduce exposure of sensitive information, and align with privacy standards such as PCI DSS and GDPR.

#### NEW QUESTION # 43

Which security testing method requires compliance with the cloud service provider's terms of service?

- A. Vulnerability assessment
- B. Continuous delivery pipeline
- C. Static analysis
- D. Code review

**Answer: A**

Explanation:

A vulnerability assessment requires compliance with the cloud service provider's terms of service.

Managing Cloud documentation explains that vulnerability scanning and testing can affect cloud infrastructure and other tenants if not properly authorized.

CSPs define acceptable testing activities to protect shared environments. Customers must follow these guidelines to avoid violating contracts or causing service disruptions. Many CSPs require prior notification or explicit permission before conducting vulnerability assessments.

The other methods involve internal development processes and do not impact cloud infrastructure directly.

Therefore, vulnerability assessment is the correct answer.

#### NEW QUESTION # 44

Which logical design model includes the foundations of a secure computing system, such as computing, networking, and storage?

- A. Metastructure

- B. Infrastructure
- C. Applistructure
- D. Infostructure

**Answer: B**

Explanation:

The Infrastructure logical design model includes the foundational components of a secure computing system, such as compute, networking, and storage. Managing Cloud principles explain that infrastructure represents the base layer upon which all other cloud services and security controls are built.

This layer includes physical and virtual servers, network connectivity, storage systems, and the virtualization technologies that enable resource sharing. Securing the infrastructure is critical because weaknesses at this level can compromise higher-level services and applications. Controls such as network segmentation, secure configurations, redundancy, and access restrictions are applied at the infrastructure level to protect workloads and data.

Infostructure focuses on data and information handling, applistructure relates to applications and services, and metastructure supports orchestration and management. Therefore, infrastructure correctly represents the foundational logical design model for secure cloud computing.

#### NEW QUESTION # 45

Which factor should be the basis of a business continuity plan?

- A. Locations
- B. Customers
- C. Costs
- D. Risks

**Answer: D**

Explanation:

Risk is the foundational factor upon which a business continuity plan (BCP) should be based. Managing Cloud principles explain that BCP development begins with identifying and analyzing risks that could disrupt critical business operations.

Risk assessment evaluates threats, vulnerabilities, and potential impacts, allowing organizations to prioritize resources and define recovery strategies. By focusing on risk, organizations ensure that continuity planning addresses the most significant threats to operations, data, and services.

Costs, customers, and locations are important considerations but are secondary to risk analysis. Therefore, risks form the correct basis for a business continuity plan.
