問題 #30

A start-up company wants to build its computer network by starting with the base-level resources offered by a cloud service. In this way, the company won't have to buy physical hardware but can still have complete control over operating systems and other software.

Which cloud service model should be used?

- A. Function as a Service (FaaS)
- B. Platform as a Service (PaaS)
- C. Software as a Service (SaaS)
- **D. Infrastructure as a Service (IaaS)**

答案： D

解題說明：

Infrastructure as a Service (IaaS) provides virtualized computing resources, including virtual machines, storage, and networking, while allowing users full control over operating systems and applications. Examples include AWS EC2 and Google Compute Engine.

* SaaS provides ready-to-use applications (e.g., Google Docs).

* FaaS runs code in response to events (e.g., AWS Lambda).

* PaaS provides development environments but not full infrastructure control.

問題 #31

A library has a network that allows patrons to use their mobile devices to connect to the internet.

Which type of network is described?

- **A. WLAN**
- B. SAN
- C. MAN
- D. PAN

答案： A

解題說明：

A Wireless Local Area Network (WLAN) enables wireless connectivity within a defined geographic area, such as a library, office, or coffee shop. WLANs use Wi-Fi technology to allow users to access the internet without physical cables.

* Storage Area Networks (SANs) are used for data storage and do not provide internet connectivity to users.

* Metropolitan Area Networks (MANs) cover larger areas, such as cities, and are not used within a single building.

* Personal Area Networks (PANs) connect personal devices like smartphones and laptops over short distances, such as via Bluetooth, but do not support public internet access.

問題 #32

Which layer of the OSI model includes the ICMP?

- **A. Network**
- B. Session
- C. Transport
- D. Application

答案： A

解題說明：

The Network layer (Layer 3 of the OSI model) includes the Internet Control Message Protocol (ICMP), which is used for network

diagnostics (e.g., ping command). ICMP helps in error reporting and network troubleshooting.

* Transport layer handles reliable data delivery (e.g., TCP, UDP).

* Session layer manages communication sessions.

* Application layer provides end-user services.

問題 #33

Access to a company's information system requires a user to be within a valid geographic location and to enter a valid username and password.

Which concept does this scenario demonstrate?

- A. User-based accounting
- B. Single sign-on
- **C. Multifactor authentication**
- D. Certificate verification

答案： C

解題說明：

Multifactor authentication (MFA) requires users to verify their identity using multiple factors, such as something they know (password), something they have (a token or phone), or somewhere they are (geolocation-based access control). Requiring both location verification and password authentication demonstrates MFA.

* Certificate verification checks digital certificates for security but does not use multiple authentication factors.

* User-based accounting logs user activities but does not verify identity.

* Single sign-on (SSO) allows access to multiple systems with one login but is not necessarily MFA.

問題 #34

An organization is the victim of an attack in which an attacker intercepts messages between two parties before transferring them to the correct destination.

What is the type of cyberattack described in this scenario?

- A. Social engineering
- **B. Man-in-the-middle attack**
- C. Pharming
- D. Credential stuffing

答案： B

解題說明：

A man-in-the-middle (MITM) attack occurs when an attacker secretly intercepts and relays communication between two parties. This allows the attacker to steal data, modify messages, or inject malicious content without the victims' knowledge.

* Credential stuffing reuses stolen login credentials but does not involve interception.

* Social engineering manipulates users rather than intercepting messages.

* Pharming redirects users to fraudulent websites, but it does not intercept communication.
