

F5CAB3 Dumps & F5CAB3 Valid Test Practice

The screenshot shows a configuration page for a virtual server. The 'General Properties' section includes fields for Name (VS-DNS), Partition / Path (Common), Description, Type (Standard), Source Address (192.168.100.0/23), Destination Address/Mask (192.168.21.50), Service Port (53), Notify Status to Virtual Address (checked), Link (None), Availability (Unknown (Enabled)), Syncookie Status (Off), and State (Enabled). The 'Configuration' section is set to 'Advanced' and includes Protocol (TCP), Protocol Profile (Client) (tcp), and Protocol Profile (Server) (Use Client Profile).

What's more, part of that Dumpkiller F5CAB3 dumps now are free: <https://drive.google.com/open?id=1RMFMkFW72pjnktB4gID3HRz1GE5jT5s>

It is incontrovertible high quality and high accuracy F5CAB3 practice materials that have helped more than 98 percent of exam candidates who choose our F5CAB3 real quiz gets the certificate successfully. So we totally understand you inmost thoughts, and the desire to win the F5CAB3 Exam as well as look forward to bright future that come along. During your practice process accompanied by our F5CAB3 study guide, you will easily get the certificate you want.

F5 F5CAB3 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Apply procedural concepts required to modify and manage virtual servers: This domain covers managing virtual servers including applying persistence, encryption, and protocol profiles, identifying iApp objects, reporting iRules, and showing pool configurations.
Topic 2	<ul style="list-style-type: none"> Apply procedural concepts required to modify and manage pools: This domain addresses managing server pools including health monitors, load balancing methods, priority groups, and service port configurations.

F5CAB3 Valid Test Practice & New F5CAB3 Test Materials

We have been developing our F5CAB3 practice engine for many years. We have no doubt about our quality of the F5CAB3 exam braindumps. Our experience is definitely what you need. And especially our professional experts have been devoting in this field for over ten years. I believe no one can know the F5CAB3 training guide than them. To combine many factors, F5CAB3 real exam must be your best choice.

F5 BIG-IP Administration Data Plane Configuration Sample Questions (Q80-

Q85):

NEW QUESTION # 80

A BIG-IP Administrator uses backend servers to host multiple services per server. There are multiple virtual servers and pools defined, referencing the same backend servers.

Which load balancing algorithm is most appropriate to have an equal number of connections on each backend server? (Choose one answer)

- A. Predictive (member)
- **B. Least Connections (node)**
- C. Predictive (node)
- D. Least Connections (member)

Answer: B

Explanation:

In this scenario, each backend node (server) hosts multiple services and is referenced by multiple pools and virtual servers. The goal is to ensure an equal number of total connections per backend server, regardless of how many pool members (services/ports) exist on that server.

According to the BIG-IP Administration: Data Plane Configuration documentation:

Least Connections (node) tracks the total number of active connections to a node across all pool members and services.

This algorithm ensures load distribution is balanced at the server level, not just at the individual service (member) level.

It is specifically recommended when:

Multiple pool members exist on the same backend server

Multiple virtual servers reference the same backend servers

Why the other options are incorrect:

B . Predictive (member)

Predictive algorithms are advanced and traffic-pattern based, but they operate at the member level and do not guarantee equal connections per server.

C . Least Connections (member)

This balances connections per pool member, which can overload a server hosting multiple members while still appearing "balanced" per member.

D . Predictive (node)

Although node-aware, predictive algorithms are less deterministic and not the best choice when strict equality of connections is required.

Correct Resolution:

Using Least Connections (node) ensures that each backend server carries an equal connection load across all services and pools.

NEW QUESTION # 81

During high-demand traffic events, the BIG-IP Administrator needs to limit new connections per second.

What should be applied?

- A. HTTP Compression profile
- B. OneConnect profile
- C. Connection limit
- **D. Connection rate limit**

Answer: D

Explanation:

Connection rate limiting controls how many new connections per second are accepted, protecting backend resources.

NEW QUESTION # 82

A BIG-IP Administrator configures an SSH pool with five members.

Which health monitor should be applied?

- A. UDP
- B. HTTPS
- **C. TCP**

- D. HTTP

Answer: C

Explanation:

SSH is a TCP-based service. A TCP monitor validates service availability without requiring application-layer inspection.

NEW QUESTION # 83

A Standard Virtual Server for a web application is configured with SNAT Automap. The original client IP must be known by backend servers.

What should the BIG-IP Administrator configure?

- **A. HTTP profile with X-Forwarded-For**
- B. Performance (HTTP) Virtual Server
- C. SNAT pool using client IP
- D. HTTP Transparent profile

Answer: A

Explanation:

X-Forwarded-For inserts the original client IP into HTTP headers while SNAT is enabled.

NEW QUESTION # 84

A BIG-IP Administrator creates a new VLAN on BIG-IP Cluster Member A and attaches an interface to it.

Although the Auto Config Sync is in place, the new VLAN does NOT show up on Cluster Member B. What should the BIG-IP Administrator do to ensure the new VLAN is configured on each Cluster Member?

- A. Configure a Default Route for the new VLAN on Cluster Member A
- **B. Configure the new VLAN manually on Cluster Member B**
- C. Reset the Device Trust of the BIG-IP Cluster on either Cluster Member
- D. Enable the Interface that is attached to the new VLAN on Cluster Member A

Answer: B

Explanation:

In a BIG-IP High Availability (HA) environment, most configuration objects (Virtual Servers, Pools, iRules) are considered "shared" and are synchronized automatically between devices. However, network-level objects—specifically VLANs and Self IPs—are unique to the hardware and are generally not synchronized by the ConfigSync process.

This is intentional because two devices in a cluster may have different physical cabling or interface assignments. For example, Cluster Member A might use interface 1.1 for a specific VLAN, while Cluster Member B might use interface 1.2. Because the BIG-IP system cannot assume that the physical network topology is identical for both appliances, the administrator must Configure the new VLAN manually on Cluster Member B.

Once the VLAN is created manually on both devices with the exact same name, it can then be used to host

"shared" floating Self IP addresses or traffic groups that will synchronize. Failing to create the VLAN on the peer device will prevent the traffic group from failing over correctly, as the peer will not have the necessary Layer 2 broadcast domain defined to take over the traffic. Resetting Device Trust (Option D) is a drastic step for fix sync communication issues but will not change the fact that VLANs are non-syncable objects.

Enabling the interface (Option B) only affects the link status of Member A and has no impact on the configuration of Member B.

NEW QUESTION # 85

.....

The key trait of our product is that we keep pace with the changes the latest circumstance to revise and update our F5CAB3 study materials, and we are available for one-year free updating to our customers. Our company has established a long-term partnership with those who have purchased our F5CAB3 exam guides. We have made all efforts to update our product in order to help you deal with any change, making you confidently take part in the exam. We will inform you that the F5CAB3 Study Materials should be updated and send you the latest version of our F5CAB3 exam questions in a year after your payment.
