## VMware vSphere 8.x Advanced Design Sample Questions (Q72-Q77):

### NEW QUESTION # 72

An architect is tasked with creating a design for a vSphere-based solution.

Reviewing requirements with the security team, the architect makes the following design decision:

ESXi hosts in the environment will enable shell sandbox for SSH connections and the local ESXi shell. What is an implication of the design decision to enable shell sandboxing?

- A. The vSphere 8 hosts will operate in strict lockdown mode
- B. Only certain commands can be executed in the sandboxed shell
- C. Only administrative accounts can access the sandbox shell
- D. All commands executed in the sandbox shell will be logged

**Answer: B**

Explanation:

When the shell sandbox is enabled on ESXi hosts, it restricts the execution of commands within the shell to ensure that only authorized or safe commands are allowed. This provides a level of isolation that limits the potential for accidental or malicious commands to be run in the shell, enhancing security while still providing necessary administrative access.

### NEW QUESTION # 73

An architect is tasked with helping a customer develop a design that meets the following requirements:

Must have no single point of failure

Must include thorough standard operating procedure documentation

Must use VMXNET3 virtual network interface card

Must have 99.9% uptime Service Level Agreement

Must use the latest version of VMware vSphere

Which two are considered constraints? (Choose two.)

- A. Must use the latest version of VMware
- B. Must have 99.9% uptime Service Level Agreement
- C. Must have no single point of failure
- D. Must use VMXNET3 virtual network interface card
- E. Must include thorough standard operating procedure documentation

**Answer: A,D**

Explanation:

Must use the latest version of VMware vSphere

This is a constraint because the design must adhere to the specific requirement of using the latest version of VMware vSphere. This limits the possible versions or features that can be incorporated into the solution.

Must use VMXNET3 virtual network interface card

This is also a constraint because it mandates the use of a specific virtual network interface card (VMXNET3), restricting the design to that particular choice for network connectivity.

#### NEW QUESTION # 74

During the creation of a vSphere-based design solution, an architect identifies the following assumption:

The customer will be responsible for providing all licensing for the vSphere platform.

The storage hardware has sufficient capacity for future workload scale.

The data center offers sufficient power, cooling and rack space for workload scale.

When documenting each assumption within the design, which two corresponding pieces of information must the architect also define? (Choose two.)

- A. The data center does not have sufficient capacity to meet the requirements for workload scale.
- **B. The project sponsor is responsible for the data center capacity. The administrator is accountable and the architect is informed.**
- **C. Additional storage capacity can be procured to expand the solution in the future as needed.**
- D. Additional data center locations have been identified. Contracts will be signed to bring the capacity online within 12 months.
- E. The storage hardware may not have capacity for future workload scale.

**Answer: B,C**

#### NEW QUESTION # 75

What are assumptions in the context of design?

- A. Potential risks that could negatively impact the design's success.
- **B. Unverified beliefs or presuppositions that guide the design process.**
- C. Specific tasks and operations the design must perform.
- D. Constraints imposed by industry regulations and standards.

**Answer: B**

#### NEW QUESTION # 76

Which requirement focuses on the uninterrupted operation of the vSphere environment during disruptions?

- A. Capacity requirements
- B. Performance requirements
- **C. Business continuity requirements**
- D. Compliance requirements

**Answer: C**
