## NCLEX National Council Licensure Examination(NCLEX-RN) Sample Questions (Q852-Q857):

### NEW QUESTION # 852

The nurse would be concerned if a client exhibited which of the following symptoms during her postpartum stay?

- A. Vaginal discharge or rubra, serosa, then rubra
- B. Diaphoresis by her third postpartum day
- C. Diuresis by her second or third postpartum day
- D. Pulse rate of 50-70 bpm by her third postpartum day

**Answer: A**

Explanation:

(A)

Bradycardia is an expected assessment during the postpartum period. (B) Diuresis can occur during labor and the postpartum period and is an expected physiological adaptation.

(C)

A return of rubra after the serosa period may indicate a postpartal complication. (D) Diaphoresis, especially at night, is an expected physiological change and does not indicate an infectious process. Bradycardia, diuresis, and diaphoresis are normal postpartum physiological responses to adjust the cardiac output and blood volume to the nonpregnant state.

### NEW QUESTION # 853

The nurse observes a client crying quietly. She has just experienced a spontaneous abortion at nine weeks' gestation. An appropriate response by the nurse would be:

- A. "This must be a difficult time for you. Would you like to talk about it?"
- B. "I'm sure your other children will be a comfort for you."
- C. "Don't worry, you're still young. If I were you I'd just try again."
- D. "It must be God's will and probably is for the best."

**Answer: A**

Explanation:

(A) This response is nontherapeutic because it belittles the client's response and gives a meaningless rationalization. (B) This response acknowledges the client's feelings and demonstrates the therapeutic offering of self by the nurse. (C) This response is nontherapeutic because it does not focus on the client's feelings and offers false reassurance. (D) This response is nontherapeutic because it belittles the client's feelings and offers her advice.

### NEW QUESTION # 854

The nurse knows that children are more susceptible to respiratory tract infections owing to physiological differences. These childhood differences, when compared to an adult, include:

- A. Fewer alveoli, slower respiratory rate
- B. Diaphragmatic breathing, larger volume of air
- C. Rounded shape of chest, smaller volume of air
- D. Larger number of alveoli, diaphragmatic breathing

**Answer: C**

Explanation:

Explanation

(A) Although a child has fewer alveoli than an adult, the child's respiratory rate is faster. (B) Although a child may use diaphragmatic breathing, the adult exchanges a larger volume of air. (C) The adult has a larger number of alveoli than a child. (D) The child's chest is rounded whereas the adult chest is more of an oval shape, and the child does exchange a smaller volume of air than an adult.

### NEW QUESTION # 855

A laboratory technique specific for diagnosing Lyme disease is:

- A. Increased serum potassium level
- **B. Polymerase chain reaction**
- C. Heterophil antibody test
- D. Decreased serum calcium level

**Answer: B**

Explanation:

Section: Questions Set A

Explanation:

(A) Polymerase chain reaction is the laboratory technique specific for Lyme disease. (B) Heterophil antibody test is used to diagnose mononucleosis. (C) Lyme disease does not decrease the serum calcium level. (D) Lyme disease does not increase the serum potassium level.

### NEW QUESTION # 856

A client was admitted to the hospital for a TURP. Within 48 hours of admission and 12 hours postoperatively, both the blood pressure and pulse increased. He became agitated, thought snakes were crawling on his arms and legs, and generally became unmanageable. He pulled out his IV and urinary catheter in attempt to rid himself of the snakes. He was sweating profusely. The admission nurse's notes indicated that the client admitted to "having a few drinks now and then." He is probably experiencing which of the following?

- A. Major psychotic depression
- **B. Delirium tremens**
- C. Adjustment disorder with mixed features
- D. Generalized anxiety disorder

**Answer: B**

Explanation:

(A) Symptoms of psychotic depression must exist for at least 2 weeks, and the symptoms must represent a change from previous functioning. (B) Delirium tremens occur approximately on the second or third day following cessation or reduction of alcohol intake. Symptoms would be all those described in the situation. (C) Symptoms exhibited by this client are not exhibited in clients with anxiety disorders, who manifest excessive or unrealistic worry about life circumstances for at least 6 months. (D) Symptoms for adjustment disorders with mixed emotional features (e.g., depression and anxiety) are different from those exhibited by the client in this situation.

### NEW QUESTION # 857
