ISQI ISTQB Certified Tester Foundation Level (CTFL) v4.0 Sample Questions (Q130-Q135):

NEW QUESTION # 130
An alphanumeric password must be between 4 and 7 characters long and must contain at least one numeric character, one capital (uppercase) letter and one lowercase letter of the alphabet.
Which one of the following sets of test cases represents the correct outcome of a two-value boundary value analysis applied to the password length? (Note: test cases are separated by a semicolon)

- A. 1xB: aB11: 99rSp: 5NnN10; 4NnN10T; 44ghWn19

- B. aB11;99rSp:5NnN10;7iDD0a1x
- C. 1RhT;rSp53;3N3e10;8sBdby
- D. 1xA;aB11;Pq1ZZab;7iDD0a1x

Answer: C

Explanation:
Explanation
The correct outcome of a two-value boundary value analysis applied to the password length is the set of test cases represented by option D. Boundary value analysis is a test design technique that focuses on the values at the boundaries of an equivalence partition, such as the minimum and maximum values, or the values just above and below the boundaries. A two-value boundary value analysis uses two values for each boundary, one representing the valid value and one representing the invalid value. For example, if the valid range of values is from 4 to 7, then the two values for the lower boundary are 3 and 4, and the two values for the upper boundary are 7 and 8. The test cases in option D use these values for the password length, while also satisfying the other requirements of the password, such as containing at least one numeric character, one capital letter, and one lowercase letter. The test cases in option D are:
1RhT: a 4-character password that is valid
rSp53: a 5-character password that is valid
3N3e10: a 6-character password that is valid
8sBdby: an 8-character password that is invalid The test cases in the other options are incorrect, because they either use values that are not at the boundaries of the password length, or they do not meet the other requirements of the password. For example, the test cases in option A are:
1xA: a 3-character password that is invalid, but it does not contain a capital letter aB11: a 4-character password that is valid
Pq1ZZab: a 7-character password that is valid
7iDD0a1x: an 8-character password that is invalid References: ISTQB Certified Tester Foundation Level (CTFL) v4.0 sources and documents:

NEW QUESTION # 131
A typical test objective is to:

- A. determine the most appropriate level of detail with which to design test cases
- B. verify the compliance of the test object with regulatory requirements
- C. plan test activities in accordance with the existing test policy and test strategy verify the correct creation and configuration of the test environment

Answer: B

Explanation:
In the ISTQB CTFL Syllabus, it is stated that a key objective of testing is to verify that the test object meets regulatory requirements. This is crucial as compliance with regulatory standards ensures that the software adheres to necessary laws, guidelines, and safety standards which are often mandatory in various industries such as healthcare, finance, and aviation. Ensuring regulatory compliance helps prevent legal issues and promotes user safety and trust.

NEW QUESTION # 132
As a tester, as part of a V-model project, you are currently executing some tests aimed at verifying if a mobile app asks the user to grant the proper access permissions during the installation process and after the installation process. The requirements specification states that in both cases the app shall ask the user to grant access permissions only to the camera and photos stored on the device. However, you observe that the app also asks the user to grant access permission to all contacts on the device. Consider the following items:
[I]. Test environment
[II]. Expected result
[III]. Actual result
[IV]. Test level
[V]. Root cause
Based on only the given information, which of the items listed above, are you able to correctly specify in a defect report?

- A. [I]. [IV] and [V]

- B. [II]and [III]
- C. [I]and [IV]
- D. [II]. [Ill] and [V]

Answer: B

Explanation:
In the V-model project described in the question, the tester can identify the following based on the provided information:
* Expected result (II): The requirements specification clearly states that the app should only ask for access permissions to the camera and photos stored on the device during and after installation. This expected behavior is defined by the requirements.
* Actual result (III): The tester observes that the app also requests access to all contacts on the device, which deviates from the expected result. This actual observation can be recorded accurately.
Given these details, the tester can specify the expected result (II) and the actual result (III) in the defect report.
However, without more information, the tester cannot determine the test environment (I), the test level (IV), or the root cause (V).

* Typical contents of a defect report as mentioned in the syllabus include the expected result and the actual result observed during testing.

NEW QUESTION # 133

Which of the following statements is CORRECT about the value added by a tester to release planning?

- A. The tester writes acceptance criteria
- B. The tester estimates the testing effort for individual iterations
- C. The tester assesses the testability of the user stories
- D. The tester breaks down user stories into smaller testing tasks

Answer: C

Explanation:
During release planning, a tester adds value by assessing the testability of user stories. This involves evaluating whether the user stories are clear, concise, and testable. The tester ensures that the acceptance criteria are well-defined and that the stories can be effectively tested within the given timeframe.

* ISTQB CTFL Syllabus V4.0, Section 5.1.2 on the tester's contribution to iteration and release planning, which includes assessing the testability of user stories.

NEW QUESTION # 134

Which ONE of the following options BEST describes a key characteristic of non-functional testing?

- A. Conducting non-functional testing exclusively at the acceptance test level.
- B. Performing non-functional testing starting at the system test level.
- C. Limiting non-functional testing to security testing and performance testing only.
- D. Ensuring non-functional testing focuses only on user experience and usability.

Answer: B

Explanation:
Non-functional testing evaluates attributes like performance, security, and usability, which are typically assessed at the system test level or higher(A). It is not restricted to acceptance testing (B), goes beyond security and performance testing (C), and covers more than just user experience (D).
