### Palo Alto Networks Cloud Security Professional Sample Questions (Q105-Q110):

#### NEW QUESTION # 105

Which of the following is displayed in the asset inventory?

- A. Asset tags
- B. EC2 instances
- C. SSO users
- D. Federated users

**Answer: B**

Explanation:

The asset inventory in cloud security platforms like Prisma Cloud typically displays a wide range of cloud resources, including EC2

instances. EC2 instances are virtual servers in Amazon's Elastic Compute Cloud (EC2) for running applications on the Amazon Web Services (AWS) infrastructure. The asset inventory provides visibility into these instances, allowing security teams to monitor their configuration, security posture, and compliance status. This visibility is crucial for identifying misconfigurations, vulnerabilities, and ensuring that all EC2 instances adhere to the organization's security policies and compliance requirements.

#### NEW QUESTION # 106

The Prisma Cloud administrator has configured a new policy.  
Which steps should be used to assign this policy to a compliance standard?

- A. Custom policies cannot be added to existing standards.
- B. Open the Compliance Standards section of the policy, and then save.
- C. Create the Compliance Standard from Compliance tab, and then select Add to Policy.
- D. Edit the policy, go to step 3 (Compliance Standards), click + at the bottom, select the compliance standard, fill in the other boxes, and then click Confirm.

**Answer: D**

Explanation:

To assign a new policy to a compliance standard in Prisma Cloud, the administrator needs to edit the policy and navigate to the step where compliance standards are managed. By clicking the '+' button, the administrator can add the policy to a specific compliance standard, provide necessary details, and confirm the assignment. This integrates the custom policy into the chosen compliance standard, ensuring that compliance checks include the newly defined policy criteria.

#### NEW QUESTION # 107

Which two elements are included in the audit trail section of the asset detail view? (Choose two).

- A. Configuration changes
- B. Overview
- C. Findings
- D. Alert and vulnerability events

**Answer: A,D**

Explanation:

The audit trail section of an asset's detail view in Prisma Cloud typically includes a log of configuration changes and alert and vulnerability events associated with the asset. These elements are crucial for tracking the history of modifications to an asset's configuration and the security incidents that have affected it. This information is instrumental in understanding the security posture of the asset over time and in conducting thorough investigations after a security event has been detected.

#### NEW QUESTION # 108

Given the following JSON query:

```
$.resource[*].aws_s3_bucket exists
```

Which tab is the correct place to add the JSON query when creating a Config policy?

- A. Remediation
- B. Details
- C. Build Your Rule (Run tab)
- D. Build Your Rule (Build tab)
- E. Compliance Standards

**Answer: D**

Explanation:

When creating a Config policy in Prisma Cloud and incorporating a JSON query, the correct place to add this query is under the "Build Your Rule (Build tab)" (Option D). This section allows users to define the criteria and conditions for the policy, including specifying JSON or RQL (Resource Query Language) queries that articulate the policy's logic. The "Details" (Option B) tab is typically used for general information about the policy, such as its name and description. The "Compliance Standards" (Option E)

tab is for associating the policy with specific compliance frameworks. The "Remediation" (Option C) tab provides guidance on how to remediate any issues detected by the policy. The "Build Your Rule (Run tab)" (Option D) is not a standard option in Prisma Cloud policy configuration.

### NEW QUESTION # 109

What is an automatically correlated set of individual events generated by the firewall and runtime sensors to identify unfolding attacks?

- A. audit
- B. policy
- C. anomaly
- D. incident

**Answer: D**

Explanation:

An automatically correlated set of individual events generated by the firewall and runtime sensors to identify unfolding attacks is known as an "incident". Incidents provide a consolidated view of related security events, making it easier for administrators to understand the scope and potential impact of an attack, and to take appropriate response actions.
