New NCP-MCA Braindumps Ebook & NCP-MCA Exam Dumps.zip

If people buy and use the NCP-MCA study materials with bad quality to prepare for their exams, it must do more harm than good for their exams, thus it can be seen that the good and suitable NCP-MCA study materials is so important for people' exam that people have to pay more attention to the study materials. In order to help people pass the exam and gain the certification, we are glad to the NCP-MCA Study Materials from our company for you.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q84-Q89):

NEW QUESTION # 84

An administrator is providing users with access to the company's LOB applications through a VDI solution. The administrator received information that the company are going to hire 200 new employees who will be using these applications. The environment is monitored by a third-party tool that notifies the administrator when the VDI solution is about to run out of capacity. This gives the administrator time to create additional resources and add them to the VDI solution.

What should the administrator use when creating a playbook to automate this?

- A. A trigger based on an email
- B. A trigger based on an alert
- **C. A trigger based on an event**
- D. A trigger based on a REST API

Answer: C

Explanation:

The administrator should use a trigger based on an event when creating a playbook to automate the scaling of the VDI solution. An event trigger is a type of trigger that executes a playbook when a specific event occurs in the Nutanix environment or in a third-party system. An event trigger can be configured to listen to events from various sources, such as Prism alerts, Calm actions, or external webhooks. In this scenario, the administrator can use an event trigger to listen to the webhook from the third-party monitoring tool and execute a playbook that creates additional resources and adds them to the VDI solution.

A trigger based on a REST API is not the best option, because it requires the administrator to manually invoke the playbook using an API call. This is not as efficient or reliable as using an event trigger that automatically executes the playbook when the capacity threshold is reached.

A trigger based on an email is also not the best option, because it requires the administrator to configure an email server and a mailbox to receive the notification from the third-party tool. This adds complexity and overhead to the automation process and may not be as secure or timely as using an event trigger.

A trigger based on an alert is a valid option, but it depends on the availability and compatibility of the Prism alert system with the third-party tool. If the third-party tool can send alerts to Prism, then the administrator can use an alert trigger to execute the playbook. However, if the third-party tool does not integrate with Prism, then the administrator cannot use an alert trigger and has to use an event trigger instead.

NEW QUESTION # 85

Which option is used to test or validate scripts before deployment?

- A. Shell
- B. EScript
- C. PowerShell
- **D. Test Script**

Answer: D

Explanation:

Test Script is a feature of Nutanix Cloud Manager (NCM) Self-Service that allows users to test or validate scripts before deployment. Test Script enables users to run scripts on a VM without creating a blueprint or a runbook. Users can select a VM, choose a script type, enter the script content, and execute the script. The output of the script is displayed in the Test Script window. Test Script can be used to troubleshoot errors, verify functionality, or preview the results of a script before using it in a blueprint or a runbook. Reference: Nutanix Certified Professional - Multicloud Automation (NCP-MCA) Exam Blueprint Guide, page 14, section 3.1. Nutanix Multicloud Automation Administration (NMCAA) course, module 3, lesson 4. Validate Your Nutanix Cloud Manager Self-Service Skills + Access Special Offer.

NEW QUESTION # 86

Refer to the exhibit.

Calm encountered the error shown in the exhibit when importing a script that maps a network drive.

Upon further investigation, the Calm administrator was unable to run the script manually on a VM and discovered that elevated permissions were needed.

Which command should the administrator add to the script?

- **A. Enable-WSManCredSSP -Role Client**
- B. Disable-WSManCredSSP -Role Server -Force

- C. Enable-WSManCredSSP -Role Server
- D. Enable-WSManCredSSP -Role Server -Force

Answer: A

Explanation:

The error message indicates that the script failed to authenticate to the remote server using CredSSP. CredSSP is a security mechanism that allows a client to delegate its credentials to a remote server for authentication. To use CredSSP, both the client and the server need to enable it and configure the role and the trusted hosts. The command Enable-WSManCredSSP -Role Client enables CredSSP on the client side and specifies the remote server as a trusted host. This command should be added to the script before invoking the Invoke-Command cmdlet that runs the script block on the remote server. The other commands are either irrelevant or incorrect for this scenario. NEW QUESTION # 87

An administrator need to remove an application from Self-Service (formerly Calm). However, the VM needs to be kept up and running in the environment as it hosts important data.

How can the administrator accomplish this tasks in the simplest way?

- A. Create a snapshots of the VMs and re-deploy it with a new name.
- B. Go to the Manage tab of the application and select the Delete action.
- **C. Go to the Manage tab of the application and select the Delete action.**
- D. Export the VM and then delete the application and re-deploy the VM.

Answer: C

Explanation:

To remove an application from Self-Service (formerly Calm) while keeping the VM up and running, the administrator should: Go to the Manage tab of the application in Self-Service.

Select the Delete action.

By doing this, the application will be removed from the management of Self-Service, but the VM will remain running in the environment.

NEW QUESTION # 88

What role must a user have in order to create or update a Playbook?

- A. Calm Developer
- **B. Prism Admin**
- C. Calm Admin
- D. Project Admin

Answer: B

NEW QUESTION # 89

.....

Our NCP-MCA learning questions are famous for that they are undeniable excellent products full of benefits, so our exam materials can spruce up our own company image. Besides, our NCP-MCA study quiz is priced reasonably, so we do not overcharge you at all. Not only the office staff can buy it, the students can also afford it. Meanwhile, our NCP-MCA Exam Materials are demonstrably high effective to help you get the essence of the knowledge which was convoluted. You will get more than you can imagine by our NCP-MCA learning guide.
