SPLK-1004 Test Pdf - SPLK-1004 Valid Exam Duration

You can become part of this skilled and qualified community. To do this joust enroll in the Itcertking Splunk SPLK-1004 certification exam and start preparation with real and valid Splunk Core Certified Advanced Power User (SPLK-1004) exam practice test questions right now. The Itcertking SPLK-1004 Exam Practice test questions are checked and verified by experienced

and qualified SPLK-1004 exam trainers. So you can trust Itcertking Splunk SPLK-1004 exam practice test questions and start preparation with confidence.

Splunk Core Certified Advanced Power User Sample Questions (Q91-Q96):

NEW QUESTION # 91

How is a cascading input used?

- A. As a default way to delete a user role.
- **B. As a way to filter other input selections.**
- C. As part of a dashboard, but not in a form.
- D. Without notation in the underlying XML.

Answer: B

Explanation:

A cascading input is used to filter other input selections in a dashboard or form, allowing for a dynamic user interface where one input influences the options available in another input.

Cascading Inputs:

* Definition: Cascading inputs are interconnected input controls in a dashboard where the selection in one input filters the options available in another. This creates a hierarchical selection process, enhancing user experience by presenting relevant choices based on prior selections.

Implementation:

* Define Input Controls:

* Create multiple input controls (e.g., dropdowns) in the dashboard.

* Set Token Dependencies:

* Configure each input to set a token upon selection.

* Subsequent inputs use these tokens to filter their available options.

Example:

Consider a dashboard analyzing sales data:

* Input 1: Country Selection

* Dropdown listing countries.

* Sets a token \$country\$ upon selection.

* Input 2: City Selection

* Dropdown listing cities.

* Uses the \$country\$ token to display only cities within the selected country.

XML Configuration:

```
<input type="dropdown" token="country">
<label>Select Country</label>
<choice value="USA">USA</choice>
<choice value="Canada">Canada</choice>
</input>
<input type="dropdown" token="city">
<label>Select City</label>
<search>
<query>index=sales_data country=$country$ | stats count by city</query>
</search>
</input>
```

In this setup:

* Selecting a country sets the \$country\$ token.

* The city dropdown's search uses this token to display cities relevant to the selected country.

Benefits:

* Improved User Experience: Users are guided through a logical selection process, reducing the chance of invalid or irrelevant selections.

* Data Relevance: Ensures that dashboard panels and visualizations reflect data pertinent to the user's selections.

Other Options Analysis:

B: As part of a dashboard, but not in a form.

* Explanation: Cascading inputs are typically used within forms in dashboards to collect user input. This option is incorrect as it suggests a limitation that doesn't exist.

C: Without token notation in the underlying XML:

* Explanation: Cascading inputs rely on tokens to pass values between inputs. Therefore, token notation is essential in the XML

configuration.

D: As a default way to delete a user role:

* Explanation: This is unrelated to the concept of cascading inputs.

Conclusion:

Cascading inputs are used in dashboards to create a dependent relationship between input controls, allowing selections in one input to filter the options available in another, thereby enhancing data relevance and user experience.

NEW QUESTION # 92

What does the query `| makeresults` generate?

- A. A timestamp
- **B. A results field**
- C. An error message
- D. The results of the previously run search

Answer: B

Explanation:

The `| makeresults` command generates a single event containing default fields, such as `_time`. It's mainly used to create sample data or placeholder events for testing purposes. The primary field it generates is `_time`, but the command is used to generate a base event that can be manipulated further.

NEW QUESTION # 93

Which commands should be used in place of a subsearch if possible?

- A. `untable` and/or `xyseries`
- **B. `stats` and/or `eval`**
- C. `mvexpand` and/or `where`
- D. `bin` and/or `where`

Answer: B

Explanation:

Using `stats` and/or `eval` commands in place of a subsearch is often recommended for performance optimization in Splunk searches. Subsearches can be resource-intensive and slow, especially when dealing with large datasets or complex search operations. The `stats` command is versatile and can be used for aggregation, summarization, and calculation of data, often achieving the same goals as a subsearch but more efficiently.

The `eval` command is used for field calculations and conditional evaluations, allowing for the manipulation of search results without the need for a subsearch. These commands, when used effectively, can reduce the processing load and improve the speed of searches.

NEW QUESTION # 94

Which of the following is true about the preview feature and macros?

- A. The preview feature can be launched using Tab-Shift-E on Mac or Windows.
- B. The preview feature can be launched by right-clicking on the macro name in the search string.
- **C. The preview feature expands all macros within the search, including nested macros.**
- D. The preview feature expands only the selected macro within the search.

Answer: C

Explanation:

Comprehensive and Detailed Step by Step Explanation:

The preview feature in Splunk expands all macros within a search, including any nested macros, to show their full definitions. This allows users to review the complete structure of the search query after all macros have been resolved.

Here's why this works:

* Macro Expansion: Macros are placeholders for reusable search logic. When the preview feature is used, Splunk replaces all macro references with their corresponding definitions, including those nested within other macros.

* Full Visibility: Expanding all macros ensures that users can see the entire search logic, which is especially helpful for debugging or understanding complex queries.

Other options explained:

* Option A: Incorrect because the preview feature expands all macros, not just the selected one.

* Option B: Incorrect because the keyboard shortcut Tab-Shift-Eis not valid for launching the preview feature.

* Option C: Incorrect because right-clicking on a macro name does not launch the preview feature; it is typically accessed through the Splunk UI or specific commands.

NEW QUESTION # 95

Which commands should be used in place of a subsearch if possible?

- A. untable and/or xyseries
- **B. stats and/or eval**
- C. mvexpand and/or where
- D. bin and/or where

Answer: B

Explanation:

stats and eval are recommended over subsearches because they are more efficient and scalable. Subsearches can be slow and resource-intensive, whereas stats aggregates data, and eval performs calculations within the search.

The stats and eval commands should be used instead of subsearches whenever possible because subsearches have performance limitations. They return only a maximum of 10,000 results or execute within 60 seconds by default, which may cause incomplete results. Using stats allows aggregation of large datasets efficiently, while eval can manipulate field values within a search rather than relying on subsearches.
