HPE7-A01 Sure Answers & HPE7-A01 Free Torrent & HPE7-A01 Exam Guide

What's more, part of that Lead2Passed HPE7-A01 dumps now are free: https://drive.google.com/open?id=1HrGbbshLf5Sp-QwO3DiBy5IyyDX_T2KE

On each attempt, the HP HPE7-A01 practice test questions taker will provide a score report. With this report, one can find mistakes and remove them for the final attempt. A situation that the web-based test creates is similar to the HPE7-A01 Real Exam Questions. Practicing in this situation will help you kill Aruba Certified Campus Access Professional Exam (HPE7-A01) exam anxiety. The customizable feature of this format allows you to change the settings of the Aruba Certified Campus Access Professional Exam (HPE7-A01) practice exam.

HPE7-A01 exam is a professional-level certification that requires thorough knowledge and practical experience in Aruba technologies. Aruba Certified Campus Access Professional Exam certification exam is challenging and has a time limit of 90 minutes. Candidates must score at least 75% to pass the exam and earn the certification. HPE7-A01 Exam is available in multiple languages and can be taken online or at a testing center.

# HPE7-A01 Valid Vce Dumps Makes Passing Aruba Certified Campus Access Professional Exam More Convenient

Lead2Passed has been designing and offering real HP Aruba Certified Campus Access Professional Exam exam dumps for many years. We regularly update our valid HP HPE7-A01 certification test preparation material to keep them in line with the current Aruba Certified Campus Access Professional Exam (HPE7-A01) exam content and industry standards. Professionals from different countries give us their valuable feedback to refine HPE7-A01 actual dumps even more.

HP Aruba Certified Campus Access Professional Exam Sample Questions (Q145-Q150):

NEW QUESTION # 145
A customer just upgraded aggregation layer switches and noticed traffic dropping for 120 seconds after the aggregation layer came online again.
What is the best way to avoid having this traffic dropped given the topology below?
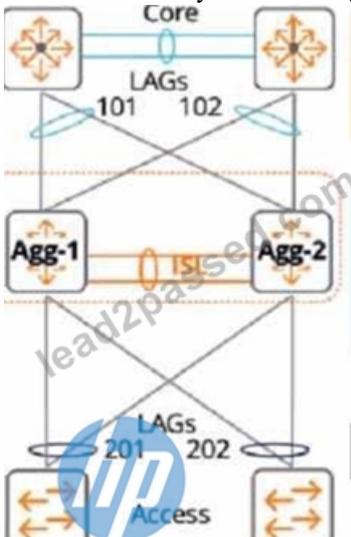

- A. Configure the linkup delay timer to exclude LAGS 101 and 102, which will allow time for routing adjacencies to form and to learn upstream routes
- B. Configure the linkup delay timer to include LAGs 101 and 102, which will allow time for routing adjacencies lo form and to learn upstream routes
- C. Configure the linkup delay timer to 120 seconds, which will allow the right amount of time for the initial phase to sync
- D. Configure the linkup delay timer to 240 seconds to double the amount of lime for the initial phase to sync

Answer: B

Explanation:
The reason is that the linkup delay timer is a feature that delays bringing downstream VSX links up, following a VSX device reboot or an ISL flap. The linkup delay timer has two phases: initial synchronization phase and link-up delay phase.
The initial synchronization phase is the download phase where the rebooted node learns all the LACP+MAC+ARP+STP database entries from its VSX peer through ISLP. The initial synchronization timer, which is not configurable, is the required time to download the database information from the peer.
The link-up delay phase is the duration for installing the downloaded entries to the ASIC, establishing router adjacencies with core nodes and learning upstream routes. The link-up delay timer default value is 180 seconds. Depending on the network size, ARP/routing tables size, you might be required to set the timer to a higher value (maximum 600 seconds). When both VSX devices reboot, the link-up delay timer is not used. Therefore, by configuring the linkup delay timer to include LAGs 101 and 102, which are part of the same VSX device as LAG 201, you can ensure that both devices have enough time to synchronize their databases and form routing adjacencies before bringing down their downstream links.

NEW QUESTION # 146
Using Aruba best practices what should be enabled for visitor networks where encryption is needed but authentication is not required?

- A. Wired Equivalent Privacy
- B. Wi-Fi Protected Access 3 Enterprise
- C. Opportunistic Wireless Encryption
- D. Open Network Access

Answer: C

Explanation:
Explanation
Opportunistic Wireless Encryption (OWE) is a feature that provides encryption for open wireless networks without requiring authentication. OWE uses an enhanced version of the 4-way handshake to establish a pairwise key between the client and the AP, which is then used to encrypt the wireless traffic using WPA2 or WPA3 protocols. OWE can be used for visitor networks where encryption is needed but authentication is not required. References: https://www.arubanetworks.com/assets/tg/TG_OWE.pdf

NEW QUESTION # 147
You are configuring an SVI on an Aruba CX switch that needs to have the following characteristics:
* VLANID = 25
. IPv4 address 10 105 43 1 with mask 255 255 255.0
* IPv6 address fd00:5708::f02d:4df6 with a 64 bit prefix length
* member of VRF eng
* VRF eng and VLAN 25 have not yet been created
Which command lists will satisfy the requirements with the least number of commands?

- A.
```
interface vlan 25
vrf attach eng
ip address 10.105.43.1/24
ipv6 address fd00:5708::f02d:4df6/64
```

```
vrf eng
vlan 25
interface vlan 25
ip address 10.105.43.1/24
ipv6 address fd00:5708::f02d:4df6/64
vrf attach eng
```

- B.

```
vrf eng
vlan 25
interface vlan 25
ip address 10.105.43.1 255.255.255.0
ipv6 address fd00:5708::f02d:4df6/64
vrf attach eng
```

- C.

```
interface vlan 25
vrf attach eng
ip address 10.105.43.1/24
ipv6 address fd00:5708::f02d:4df6/64
```

- D.

Answer: D

Explanation:
The other options either use more commands or do not create the VRF or the VLAN.
Option C uses the following commands:
* vrf eng: This command creates a VRF named eng and enters the VRF configuration mode1.
* vlan 25: This command creates a VLAN with ID 25 and enters the VLAN configuration mode2.
* interface vlan 25: This command creates an SVI on VLAN 25 and enters the interface configuration mode3.
* ip address 10.105.43.1/24 ipv6 address fd00:5780::102d:4df6/64 vrf attach eng: This command assigns an IPv4 address of 10.105.43.1 with a subnet mask of 255.255.255.0 and an IPv6 address of fd00:5780::102d:4df6 with a prefix length of 64 to the SVI, and attaches it to the VRF eng.

NEW QUESTION # 148
What is the best practice for handling voice traffic with dynamic segmentation on AOS-CX switches?

- A. Switch authentication and user-based tunneling of the voice traffic.
- B. Central authentication and port-based tunneling of the voice traffic.
- C. Controller authentication and port-based tunneling of all traffic
- D. Switch authentication and local forwarding of the voice traffic

Answer: D

Explanation:
This is the best practice for handling voice traffic with dynamic segmentation on AOS-CX switches. Dynamic segmentation is a feature that allows AOS-CX switches to tunnel user traffic to a controller or another switch based on user roles and policies. For voice traffic, it is recommended to use switch authentication and local forwarding, which means the voice devices are authenticated by the switch and their traffic is forwarded locally without tunneling. This reduces latency and jitter for voice traffic and improves voice quality. The other options are incorrect because they either use central authentication or tunneling, which are not optimal for voice traffic. Reference: https://www.arubanetworks.com/techdocs/AOS-CX/10.04/HTML/5200-6728/bk01-ch05.html

NEW QUESTION # 149
Match each PoE power class to Its corresponding 802.3 standard. (Options may he used more than once or not at all)

802.3at	802.3bt	802.3af		Answer Area

	Class 3 (15.4W)
	Class 4 (30W)
	Class 6 (60W)
	Class 8 (90W)

Answer:

Explanation:

802.3at	802.3bt	802.3af		Answer Area

802.3af	Class 3 (15.4W)
802.3at	Class 4 (30W)
802.3bt	Class 6 (60W)
802.3bt	Class 8 (90W)

Explanation:
* Class 3 (15.4W): 802.3af
* Class 4 (30W): 802.3at
* Class 6 (60W): 802.3bt
* Class 8 (90W): 802.3bt

NEW QUESTION # 150
