## Mule-Dev-202 Authorized Test Dumps | Latest Mule-Dev-202 Exam Pattern

For candidates who are going to buy the exam dumps for the exam, the quality must be one of the most standards while choosing the exam dumps. Mule-Dev-202 exam dumps are high quality and accuracy, since we have a professional team to research the first-rate

information for the exam. We have reliable channel to ensure that Mule-Dev-202 Exam Materials you receive is the latest one. We offer you free update for one year, and the update version for Mule-Dev-202 exam materials will be sent to your automatically. We have online and offline service, and if you have any questions for Mule-Dev-202 exam dumps, you can consult us.

## Salesforce Certified MuleSoft Hyperautomation Developer Sample Questions (Q19-Q24):

### NEW QUESTION # 19

The MuleSoft development team at Northern Trail Outfitters creates a Mule application that interacts with several APIs and RPA processes. The team needs to share this application with other teams to help them create similar applications.

How should the Mule application be published in Anypoint Exchange to meet this requirement?

- A. Custom asset
- B. Connector asset
- C. API asset
- D. Template asset

**Answer: D**

Explanation:

To share a Mule application that interacts with several APIs and RPA processes with other teams for creating similar applications, publishing it as a Template asset is the best approach:

Template Asset:

A Template in Anypoint Exchange is designed to provide a reusable solution that can be easily adapted for different use cases. It includes predefined integration logic and configurations that can be used as a starting point for new projects.

By publishing the Mule application as a Template, other teams can leverage this pre-built solution, customize it to their specific needs, and ensure consistency in integration practices across the organization.

Anypoint Exchange Templates Documentation

### NEW QUESTION # 20

Northern Trail Outfitters evaluates multiple standards for the exit criteria of a stage in their Flow Orchestration. Based on their criteria, they want the flow to go down one of three paths.

How should this be built in Flow Orchestration to meet this requirement?

- A. Have the evaluation flow return a number variable, and use a decision element to determine which path to execute.
- B. Use the evaluation flow to determine the exit criteria for the current stage. Then, use a separate evaluation flow to determine the entry criteria for each of the three paths.
- C. Evaluate the criteria for the first two paths in an evaluation flow. Then, use the default path functionality of the decision element for the third path.
- D. Create two evaluation flows, and execute the second evaluation flow if the first evaluation flow returns false.

**Answer: A**

Explanation:

To implement branching logic based on multiple criteria in Flow Orchestration, you can use the following approach:

Evaluation Flow Returns a Number Variable:

Create an evaluation flow that assesses the exit criteria for the current stage and returns a number variable indicating which path to take (e.g., 1, 2, or 3).

Decision Element:

Use a decision element in Flow Orchestration to evaluate the number variable returned by the evaluation flow.

Based on the value of the variable, the decision element will determine which path to execute next.

This approach allows for clear and maintainable branching logic, ensuring that the flow can proceed down one of three paths based on the defined criteria.

Salesforce Flow Orchestration Documentation

### NEW QUESTION # 21

Northern Trail Outfitters set up a MuleSoft Composer integration between Salesforce and NetSuite that updates the Order object in Salesforce with data from NetSuite.

When an order in Salesforce is updated as complete, the Last Order Date custom field on the related account should automatically update with the date the order was marked complete.

What is the best practice to achieve this outcome?

- **A. Create a record-triggered flow on the Order object that updates the related account when the order is marked complete.**
- B. Replace the MuleSoft Composer integration with a three-tier API integration between Salesforce and NetSuite using Anypoint Platform
- C. Create a MuleSoft RPA bot that updates the related account when the order is marked complete.
- D. Update the MuleSoft Composer integration to also update the related account when the order is marked complete.

**Answer: A**

Explanation:

To update the Last Order Date custom field on the related account when an order is marked complete in Salesforce, the best practice is to use a record-triggered flow:

Create a Record-Triggered Flow:

Use Salesforce Flow to create a record-triggered flow on the Order object.

Set the flow to trigger when a record is updated (specifically, when the order status is updated to complete).

Update the Related Account:

In the flow, use a Get Records element to fetch the related Account record.

Use an Update Records element to update the Last Order Date custom field on the related Account with the date the order was marked complete.

This approach ensures that the data remains within Salesforce and is updated immediately as part of the same transaction, providing a robust and efficient solution.

## NEW QUESTION # 22

Northern Trail Outfitters needs to develop an application network that follows a MuleSoft-recommended, API-led connectivity approach and meets the following requirements:

provides data to mobile and web interfaces

aggregates and transforms data

retrieves data from databases

In which API tier should the data aggregation and transformation take place?

- **A. Process**
- B. Business
- C. System
- D. Experience

**Answer: A**

Explanation:

API-led Connectivity: MuleSoft's API-led connectivity approach divides APIs into three tiers: System, Process, and Experience.

Each tier has a specific role in managing data and operations.

Reference: MuleSoft API-led Connectivity

Experience APIs: These APIs are designed to provide data to end-user interfaces, such as mobile and web applications. They typically format the data in a way that is easy for the user interface to consume.

Reference: Experience API Definition

Process APIs: Process APIs are responsible for orchestrating and executing business logic. They aggregate, transform, and process data from multiple sources before passing it to Experience APIs or other downstream systems.

Reference: Process API Role

System APIs: These APIs provide direct access to core systems and data sources. They handle CRUD (Create, Read, Update, Delete) operations and expose data from underlying systems.

Reference: System API Role

Data Aggregation and Transformation: Given the requirements to aggregate and transform data, the Process tier is the appropriate place. Process APIs handle complex business logic and data transformation, making them ideal for aggregating data from multiple sources and transforming it as needed.

### NEW QUESTION # 23

Which MuleSoft deployment strategy consists of the control plane and runtime plan hosted by the client?

- A. Private Cloud Edition
- B. CloudHub
- C. Runtime Fabric
- **D. Hybrid**

**Answer: D**

Explanation:

A hybrid deployment strategy in MuleSoft involves hosting the control plane (Anypoint Platform management and design tools) in the cloud, while the runtime plane (where Mule applications run) is hosted by the client, either on-premises or in their own private cloud: Hybrid Deployment:

The control plane is managed by MuleSoft and provides centralized management, monitoring, and deployment capabilities.

The runtime plane is hosted by the client, providing flexibility and control over where and how the Mule applications are executed, whether on-premises or in a private cloud environment.

Benefits:

This approach combines the advantages of cloud-based management with the control and customization available in on-premises or private cloud deployments, making it suitable for organizations with specific hosting and compliance requirements.
