- A. CPU is not installed correctly on the server. Review the OS dmesg logs for any odd CPU messages, then if located proceed to reseat the CPU.

- C. The GPU baseboard may not be detected. You can determine this by opening the IPMI GUI and reviewing the FW section.
- D. You suspect there are GPUs not detected. To determine which GPUs are missing, open the IPMI GUI and review the GPU component section to make sure all GPUs are present.

Answer: D

Explanation:
If ROCm commands fail to provide output, the primary issue is likely missing or undetected GPUs. The best way to validate this is by checking the IPMI GUI and reviewing the GPU component section to ensure that all GPUs are present.
* Option A (Correct): Missing GPUs are the most common cause of ROCm failures. The IPMI GUI provides visibility into which GPUs are detected.
* Option B (Incorrect): CPU misalignment would cause general system failure, not ROCm-specific issues.
* Option C (Incorrect): The GPU baseboard status can be checked in IPMI but is not the primary cause of ROCm failures.
