

高品質IdentityIQ-Associate日本語解説集 & 認定試験のリーダー & 無料PDF IdentityIQ-Associateテスト対策書

私たち SailPoint が提供する IdentityIQ-Associate クイズトレントは、理論と実践の最新の開発に基づいた深い経験を持つ専門家によってコンパイルされているため、非常に価値があります。製品を購入する前に、まず製品を試してください。Xhs1991 の IdentityIQ-Associate 試験の合格に役立つだけでなく、時間とエネルギーを節約できるため、IdentityIQ-Associate 試験準備を購入する価値があります。お客様の満足が私たちのサービスの目的です。IdentityIQ-Associate クイズトレントを簡単に SailPoint Certified IdentityIQ Associate Exam 購入してください。

SailPoint IdentityIQ-Associate Exam Overview:

Certification Vendor:	SailPoint
Exam Name:	SailPoint IdentityIQ Associate Certification Exam
Exam Number:	IdentityIQ-Associate
Available Languages:	English
Related Certifications:	SailPoint Identity Security Cloud Certifications SailPoint Certified IdentityIQ Professional
Exam Format:	Multiple choice
Recommended Training:	Identity Security Learning Resources SailPoint IdentityIQ Fundamentals Training
Exam Registration:	SailPoint Training and Certification Portal
Sample Questions:	SailPoint IdentityIQ-Associate Sample Questions
Exam Way:	Typically delivered via online proctored exam or authorized testing centers (varies by region and provider policies).
Pre Condition:	Recommended basic understanding of identity governance concepts and familiarity with SailPoint IdentityIQ is beneficial.
Official Syllabus URL:	https://www.sailpoint.com/services/training-certification

IdentityIQ-Associateテスト対策書、IdentityIQ-Associate認定資格試験問題集

SailPoint 証明書を取得することは、あなたのキャリアにおける地位を高める素晴らしい迅速な方法です。IdentityIQ-Associate 試験に合格するというこの目標を達成するには、外部の支援が必要です。弊社が市場で最も人気のあるベンダーであるため、このリンクをクリックすると幸運です。私たちはこのキャリアに10年以上携わっており、IdentityIQ-Associate 試験問題では、夢の SailPoint 認定を得るための支援を受けるだけでなく、オンラインで一流のサービスを楽しむことができます。

SailPoint IdentityIQ-Associate 認定試験の出題範囲:

トピック	出題範囲
トピック 1	• Applications: Focuses on how applications and connectors are configured in IdentityIQ, including schemas, correlation, aggregation tasks, and resolving uncorrelated accounts.
トピック 2	• User-Driven Requests: Explains how users submit access requests, what request types are available, and how QuickLink Populations control who can request what for whom.
トピック 3	• Access Modeling: Covers how entitlements and roles are defined, cataloged, and assigned to identities within IdentityIQ.
トピック 4	• Identity Modeling: Explains how identity data is structured and managed through IdentityCubes, identity attributes, groups, populations, and manager correlation.
トピック 5	• Foundational Concepts: Covers the core purpose of identity security, key IdentityIQ terminology, system components, and how rules, tasks, workflows, and business modeling fit into the platform.

SailPoint Certified IdentityIQ Associate Exam 認定 IdentityIQ-Associate 試験問題 (Q70-Q75):

質問 # 70

Is this a purpose of identity governance and administration (IGA)?
Recording which data a user downloads

- A. Yes
- B. No

正解: B

解説:

Recording which data a user downloads is not a core purpose of Identity Governance and Administration in SailPoint IdentityIQ. IGA is concerned with governing identities, accounts, access, entitlements, roles, policy violations, certifications, access requests, and provisioning. Its central objective is to answer questions such as who a user is, what access they have, whether that access is appropriate, who approved it, and whether access complies with defined business and security policies.

Tracking the specific files, records, or data objects downloaded by a user is typically associated with data activity monitoring, data loss prevention, security information and event management, or user behavior analytics. IdentityIQ may integrate with other systems and can govern access to applications or repositories that contain sensitive data, but it does not primarily function as a tool for recording every data download event.

In IdentityIQ terms, the governance focus is identity security: access visibility, access certification, policy enforcement, role modeling, lifecycle management, and provisioning controls. Reference topics: Foundational Concepts, purpose of identity security, common IdentityIQ terms, governance model, certifications, policies, and provisioning.

質問 # 71

Is this a valid reason to grant an identity an IdentityIQ capability?
To give them elevated permissions on a connected application

- A. Yes
- B. No

正解: B

解説:

No. IdentityIQ capabilities are used to control what a user can do inside SailPoint IdentityIQ, not to grant elevated permissions on a connected target application. A capability defines access to IdentityIQ functions such as administration, reporting, certification management, policy management, role management, access request functions, or other internal product features. Capabilities are part of IdentityIQ's internal authorization model and determine which menus, pages, actions, and administrative operations a logged-in

IdentityIQ user may perform.

Elevated permissions on a connected application must be granted through governed access, such as requesting or provisioning an account, entitlement, role, or permission on that target system. That process is handled through access requests, approval workflows, provisioning plans, connector operations, and application-specific provisioning policies. For example, adding a privileged group in Active Directory or assigning an administrative application role would be modeled as target-system access, not as an IdentityIQ capability.

Therefore, granting an IdentityIQ capability is appropriate when the user needs additional permissions within IdentityIQ itself, not when they need elevated access on an external connected application. Reference topics: Identity Modeling - how IdentityIQ access is granted to users; User-Driven Requests - access requests; Provisioning - target application access fulfillment.

質問 # 72

Is this a use of the data provided by the entitlement catalog?

Provide user-friendly entitlement display names for use in access requests, reports, and certifications.

- A. No
- **B. Yes**

正解: B

解説:

Yes. This is a primary use of the entitlement catalog in SailPoint IdentityIQ. Entitlements aggregated from target applications are often technical values, such as group names, permission codes, directory groups, database roles, or application-specific access identifiers. These values may be meaningful to administrators but unclear to business reviewers, requesters, managers, or access approvers. The entitlement catalog enriches those technical access values with governance metadata, including user-friendly display names, descriptions, ownership, classification, requestability, and other attributes used across IdentityIQ.

This enriched entitlement data improves decision quality in access requests, certifications, and reports. During an access request, a requester can search and select understandable access items. During a certification, a reviewer can make better approve-or-revoke decisions because the entitlement is presented with meaningful business context. In reporting, catalog metadata makes access analysis clearer and more usable for audit and compliance teams.

Therefore, providing user-friendly entitlement display names for access requests, reports, and certifications is a correct entitlement catalog function. Reference topics: Access Modeling - entitlement catalog purpose; Governance - certifications and review context; User-Driven Requests - access request display; Applications - entitlement aggregation from group/account schemas.

質問 # 73

Is this definition of entitlement accurate?

An access right on an application

- A. No
- **B. Yes**

正解: B

解説:

Yes. In SailPoint IdentityIQ, an entitlement represents an access right, permission, privilege, group membership, role membership, or similar access-granting value on an application. Entitlements are discovered from application account data during aggregation and are commonly modeled in IdentityIQ through schema attributes marked as entitlement attributes. Once aggregated, these values may appear in the entitlement catalog as managed attributes, where they can be reviewed, requested, certified, governed by policies, and associated with roles.

The definition "an access right on an application" is accurate because entitlements describe what an identity's account is allowed to do or access within a connected system. Examples include Active Directory group membership, database roles, application permissions, cloud groups, or other system-specific access values.

IdentityIQ uses entitlements as core governance objects for certifications, access requests, policy checks, role modeling, and provisioning.

This definition is intentionally broad because different target systems represent access differently. IdentityIQ normalizes those application-specific access values into entitlement concepts for identity governance.

Reference topics: Access Modeling, entitlement catalog, managed attributes, application schema, entitlement aggregation, certifications, access requests, and provisioning.

質問 # 74

Is this statement true about attributes in IdentityIQ?
Identity attributes hold details about a user.

- A. No
- B. Yes

正解: B

解説:

The statement is true. In SailPoint IdentityIQ, identity attributes are stored on the IdentityCube and represent normalized information about a user. These attributes describe the identity at the governance level rather than describing a single account on a connected application. Common examples include first name, last name, email, department, location, job title, employee number, manager, lifecycle state, and status.

Identity attributes are important because IdentityIQ uses them throughout identity governance processes. They support identity correlation, manager correlation, certification scoping, policy evaluation, role assignment, lifecycle events, access request routing, reporting, and population or group membership. Identity attributes may be sourced from an authoritative application, derived from account data, calculated through rules, or refreshed through Identity Refresh processing.

This differs from account attributes, which are defined in an application account schema and belong to a specific application account link. Identity attributes provide the consolidated user profile that IdentityIQ uses to make governance decisions.

Reference topics: Identity Modeling - IdentityCubes, identity attributes versus account attributes, manager correlation, Identity Refresh options.
