SAP C-BCBDC-2505 시험요강:

주제	소개
주제 1	SAP Datasphere: This section of the exam measures the skills of Solution Consultants and covers a comprehensive understanding of SAP Datasphere. Candidates should demonstrate knowledge of data modeling, transformation, and harmonization using SAP Datasphere tools. It evaluates how well they can work with data layer structuring, semantic modeling, and integration to support real-time data access for various business applications.
주제 2	SAP Business Data Cloud: This section of the exam measures the skills of Data Analysts and covers core concepts of the SAP Business Data Cloud. Candidates are expected to understand its key components, integration mechanisms, and how it functions as a foundation for unified data management across SAP and non-SAP environments. The focus is on enabling data connectivity and providing governed access to data across the enterprise.

주제 3	• SAP Analytics Cloud: This section of the exam measures the skills of Data Analysts and covers the use of SAP Analytics Cloud in data visualization, story building, and dashboard creation. Candidates should be familiar with its planning and predictive capabilities, along with how to utilize data insights to drive business decision-making. It also includes managing user access and collaborating through shared analytics assets.

최신 SAP Certified Associate C-BCBDC-2505 무료샘플문제 (Q14-Q19):

질문 # 14

What are the primary purposes of SAP Business Data Cloud?

There are 2 correct answers to this question.

Response:

- A. To provide a homogeneous system landscape for data, functions, and use cases.
- B. To act solely as a data storage solution without analytics capabilities.
- C. To provide mainly manual data integration scenarios.
- D. To provide foundational services for data and analytics scenarios.

정답: A,D

질문 # 15

In an SAP Analytics Cloud planning data model, which dimensions are included by default? Note: There are 2 correct answers to this question.

- A. Entity
- B. Organization
- C. Date
- D. Version

정답: C,D

설명:

When creating a planning data model in SAP Analytics Cloud (SAC), certain dimensions are included by default to facilitate common planning scenarios. The two key dimensions automatically present are Version and Date. The Version dimension is crucial for distinguishing between different planning scenarios, such as "Actual," "Budget," "Forecast," or "Plan 2025," allowing users to compare and manage various iterations of their planning data. The Date dimension, on the other hand, is essential for time-based planning and analysis, enabling data entry, aggregation, and reporting across different time granularities like years, quarters, months, or days. These default dimensions provide a robust framework for financial and operational planning, serving as foundational elements around which planning activities are structured, and ensuring consistency and comparability across different planning versions and time periods.

질문 # 16

What do you use to write data from a local table in SAP Datasphere to an outbound target?

- A. Data Flow
- B. Replication Flow
- C. Transformation Flow
- D. CSN Export

정답: A

설명:

To write data from a local table in SAP Datasphere to an outbound target, you primarily use a Data Flow. A Data Flow in SAP Datasphere is a powerful tool designed for comprehensive data integration and transformation. It allows you to extract data from various sources (including local tables within Datasphere), perform various transformations (like joins, aggregations, filtering, scripting), and then load the processed data into a specified target. This target can be another local table, a remote table, or an outbound target like an external database or a file system. While a Replication Flow (C) is used for ingesting data into Datasphere, and a Transformation Flow (A) is not a standalone artifact for outbound writes (often part of a Data Flow), the Data Flow provides the complete framework for extracting, transforming, and loading data, including sending it to external destinations.

질문 # 17

Which features of Business Builder enhance semantic modeling?

There are 2 correct answers to this question.

Response:

- A. Define business entities
- B. Create calculated measures
- C. Assign email notifications
- D. Load CSV files directly

정답: A,B

질문 # 18

For a model in SAP Analytics Cloud you are using a live connection. Where is the data stored?

- A. Source system
- B. Public dataset
- C. SAP Analytics Cloud model
- D. Embedded dataset

정답: A

설명:

When an SAP Analytics Cloud (SAC) model utilizes a live connection, the data is not stored within SAP Analytics Cloud itself. Instead, the data resides entirely in the source system. This means that SAC directly queries the data from the connected system (e.g., SAP HANA, SAP BW, SAP S/4HANA, or SAP Datasphere) in real-time every time a user interacts with the story or application. Only metadata, such as dimension definitions and measure aggregations, is stored in SAC. This approach offers several significant advantages: it ensures that users always work with the most current data, eliminates the need for data replication, and often addresses data privacy and security concerns by keeping sensitive data within the customer's secure landscape. The "live" nature means that any changes in the source system are immediately reflected in SAC.
