VCESoft就是一個專門為Linux Foundation專業人士提供相關CGOA認證考試的資訊來源的網站。通過很多使用過VCESoft的產品的人反映，VCESoft被證明是最好的資訊來源網站。VCESoft的產品是一個很可靠的培訓工具。VCESoft提供的CGOA考試練習題的答案是非常準確的。我們的VCESoft的資深專家正在不斷地提升我們的培訓資料的品質。

Linux Foundation CGOA 考試大綱：

主題	簡介
主題 1	GitOps Terminology: This section of the exam measures the skills of DevOps Engineers and covers the foundational terms of GitOps, including declarative descriptions, desired state, state drift, reconciliation, managed systems, state stores, feedback loops, and rollback concepts.
主題 2	Related Practices: This section of the exam measures the skills of DevOps Engineers and covers how GitOps relates to broader practices like configuration as code, infrastructure as code, DevOps, and DevSecOps, along with continuous integration and delivery.
主題 3	GitOps Principles: This section of the exam measures skills of Site Reliability Engineers and covers the main principles of GitOps, such as being declarative, versioned and immutable, automatically pulled, and continuously reconciled.

主題 4	Tooling: This section of the exam measures skills of DevOps Engineers and covers the tools supporting GitOps, including manifest formats, packaging methods, state store systems such as Git and alternatives, reconciliation engines like ArgoCD and Flux, and interoperability with CI, observability, and notification tools.
主題 5	GitOps Patterns: This section of the exam measures skills of Site Reliability Engineers and covers deployment and release patterns, progressive delivery, pull versus event-driven approaches, and various architectural patterns for in-cluster and external reconcilers.

問題 #38

A GitOps project wants to leverage both ArgoCD and Flux for a deployment. Can ArgoCD and Flux be used in conjunction?

- A. If you modify their source code, ArgoCD and Flux can only be used together.
- B. ArgoCD and Flux cannot be used together as they are designed for different types of deployments.
- C. ArgoCD and Flux can be used together, leveraging a drop-in extension for ArgoCD, ensuring that both reconciliation engines do not conflict.
- D. ArgoCD and Flux cannot be used together as they have conflicting functionalities.

答案: C

解題說明:

ArgoCD and Flux are the two primary CNCF GitOps tools. While both are reconciliation engines, they can be used together carefully if configured properly to avoid conflicts. For example, Flux can be used to manage configuration sources, while ArgoCD handles application-level delivery. Extensions and integration points allow them to complement each other.

"ArgoCD and Flux implement the GitOps reconciliation principle. Though they provide overlapping functionality, they can be integrated by carefully managing their scope. For instance, Flux can manage sources and Helm charts, while ArgoCD handles higher-level deployments. Extensions exist to allow cooperation without conflict." Thus, the correct answer is C.

問題 #39

Which requirement of the GitOps principle declares that Desired State must be versioned?

- A. You must use Git in order to be compliant with this principle.
- B. The State Store must retain a complete version history.
- C. The Desired State must not be publicly accessible.
- D. The Desired State must be publicly accessible.

答案: B

解題說明:

One of the GitOps principles is Versioned and Immutable, which requires that the Desired State is stored in a system that maintains a complete version history. This allows for auditing, traceability, and rollback.

"The Desired State must be stored in a versioned, immutable system. The State Store must retain a complete version history so changes can be audited and previous states can be restored." Thus, the correct answer is B.

問題 #40

You want to route alerts from Prometheus to Slack in your GitOps workflow. Which tool can you use to achieve this?

- A. Jenkins X
- B. Alertmanager
- C. Prometheus
- D. Slack

答案: B

解題說明：

Prometheus is commonly used in GitOps for monitoring. Alertmanager is the tool integrated with Prometheus to handle alert routing. It supports sending alerts to external systems such as Slack, PagerDuty, or email.

"Prometheus generates alerts, which are routed and managed by Alertmanager. Alertmanager can integrate with messaging tools like Slack to deliver alerts in real time." Thus, the correct answer is A: Alertmanager.

問題 #41

In GitOps, which option describes State Store management?

- **A. Storing state information in a version control system.**
- B. Storing state information in a relational database.
- C. Storing state information in a distributed file system.
- D. Storing state information in a centralized database.

答案： A

解題說明：

The State Store is typically implemented using a version control system (VCS) such as Git. This ensures that the system's state is auditable, versioned, and immutable. Other systems like databases or distributed file systems do not meet the immutability and versioning requirements of GitOps.

"In GitOps, the desired state must be stored in a version control system. This serves as the State Store, providing a complete, immutable, and auditable history of changes." Thus, the correct answer is D: version control system.

References: GitOps Terminology (CNCF GitOps Working Group).

問題 #42

In a GitOps-managed workflow, what is the correct way to initiate rollback?

- A. Use Helm to rollback to a previous release version.
- **B. Create a new version based on a former version so you always "roll forward".**
- C. Overwrite your existing version with the code from your last working version.
- D. Revert to an older version and force push to the main branch.

答案： B

解題說明：

In GitOps, rollback is handled via version control. However, the practice is not to overwrite history but to roll forward by creating a new version that reverts to the configuration of a previous known-good commit. This maintains immutability and a complete audit trail.

"With GitOps, changes are versioned immutably. Rollbacks are performed by rolling forward to a commit that represents a previous known-good configuration, ensuring history is preserved." Thus, the correct GitOps approach is B.
