# Hot GH-500 PDF Questions 100% Pass | Latest Latest GH-500 Dumps: GitHub Advanced Security

DOWNLOAD the newest TroytecDumps GH-500 PDF dumps from Cloud Storage for free: https://drive.google.com/open?id=11NbaihsdZMKFSUlpp5Fez30zvDt2AY66

Our Microsoft Exam Questions greatly help GitHub Advanced Security (GH-500) exam candidates in their preparation. Our GH-500 practice questions are designed and verified by prominent and qualified GitHub Advanced Security (GH-500) exam dumps preparation experts. The qualified GitHub Advanced Security (GH-500) exam questions preparation experts strive hard and put all their expertise to ensure the top standard and relevancy of GH-500 exam dumps topics.

We have free demo of our GH-500 exam questions offering the latest catalogue and brief contents for your information on the website, if you do not have thorough understanding of our GH-500 study materials. Many exam candidates build long-term relation with our company on the basis of our high quality GH-500 Guide engine. And our GH-500 training braindumps have became their best assistant on the way to pass the exam.

Free Microsoft GH-500 Questions [2026] – Fully Updated

Good site produces high-quality GH-500 reliable dumps torrent. If you decide to purchase relating products, you should make clear if this company has power and if the products are valid. GH-500 reliable dumps torrent. Some companies have nice sales volume by low-price products, their questions and answers are collected in the internet, it is very inexact. If you really want to pass exam one-shot, you should take care about that. High-quality Microsoft GH-500 Reliable Dumps torrent with reasonable price should be the best option for you.

Microsoft GitHub Advanced Security Sample Questions (Q75-Q80):

NEW QUESTION # 75
When does Dependabot alert you of a vulnerability in your software development process?

- A. As soon as a vulnerable dependency is detected
- B. As soon as a pull request is opened by a contributor

- C. When Dependabot opens a pull request to update a vulnerable dependency
- D. When a pull request adding a vulnerable dependency is opened

Answer: A

Explanation:
Dependabot alerts are generated as soon as GitHub detects a known vulnerability in one of your dependencies. GitHub does this by analyzing your repository's dependency graph and matching it against vulnerabilities listed in the GitHub Advisory Database. Once a match is found, the system raises an alert automatically without waiting for a PR or manual action.
This allows organizations to proactively mitigate vulnerabilities as early as possible, based on real-time detection.

NEW QUESTION # 76
Secret scanning will scan:

- A. A continuous integration system.
- B. Any Git repository.
- C. External services.
- D. The GitHub repository.

Answer: D

Explanation:
Secret scanning is a feature provided by GitHub that scans the contents of your GitHub repositories for known types of secrets, such as API keys and tokens. It operates within the GitHub environment and does not scan external systems, services, or repositories outside of GitHub. Its primary function is to prevent the accidental exposure of sensitive information within your GitHub-hosted code.

NEW QUESTION # 77
When secret scanning detects a set of credentials on a public repository, what does GitHub do?

- A. It scans the contents of the commits for additional secrets.
- B. It notifies the service provider who issued the secret.
- C. It sends a notification to repository members.
- D. It displays a public alert in the Security tab of the repository.

Answer: B

Explanation:
When a public repository contains credentials that match known secret formats, GitHub will automatically notify the service provider that issued the secret. This process is known as "secret scanning partner notification". The provider may then revoke the secret or contact the user directly.
GitHub does not publicly display the alert and does not send internal repository notifications for public detections.

NEW QUESTION # 78
Which of the following options are code scanning application programming interface (API) endpoints? (Each answer presents part of the solution. Choose two.)

- A. List all open code scanning alerts for the default branch
- B. Get a single code scanning alert
- C. Modify the severity of an open code scanning alert
- D. Delete all open code scanning alerts

Answer: A,B

Explanation:
The GitHub Code Scanning API includes endpoints that allow you to:
List alerts for a repository (filtered by branch, state, or tool) - useful for monitoring security over time.
Get a single alert by its ID to inspect its metadata, status, and locations in the code.

However, GitHub does not support modifying the severity of alerts via API - severity is defined by the scanning tool (e.g., CodeQL). Likewise, alerts cannot be deleted via the API; they are resolved by fixing the code or dismissing them manually.

NEW QUESTION # 79
In the pull request, how can developers avoid adding new dependencies with known vulnerabilities?

- A. Enable Dependabot alerts.
- B. Enable Dependabot security updates.
- C. Add a workflow with the dependency review action.
- D. Add Dependabot rules.

Answer: C

Explanation:
To detect and block vulnerable dependencies before merge, developers should use the Dependency Review GitHub Action in their pull request workflows. It scans all proposed dependency changes and flags any packages with known vulnerabilities.
This is a preventative measure during development, unlike Dependabot, which reacts after the fact.
