CrowdStrike Certified Cloud Specialist Sample Questions (Q296-Q301):

NEW QUESTION # 296

You are creating a custom Indicator of Maliciousness (IOM) rule in CrowdStrike Falcon to block access to a specific malicious

domain.

Which of the following steps is correct for ensuring the IOM rule functions effectively?

- A. Add the domain to the Global Allowlist to ensure it is blocked.
- B. Assign the IOM rule a severity level of "Informational" to ensure it blocks the domain.
- **C. Select the "Domain Name" condition type and specify the domain to block.**
- D. Use the "File Hash" condition type to specify the domain's IP address.

Answer: C

Explanation:

Option A: This is correct because using the "Domain Name" condition type allows you to specify a particular domain as the target for the IOM rule. This ensures that CrowdStrike monitors and blocks activities related to the specified domain. Proper configuration of the condition type is essential for the rule to function as intended.

Option B: This is incorrect because "File Hash" is designed for identifying specific files based on their hash values, not for blocking domains or IP addresses. Using this type would result in an ineffective rule for domain blocking.

Option C: This is incorrect because the Allowlist is used to exclude entities from being flagged or blocked by CrowdStrike. Adding a domain to the Allowlist would prevent it from being blocked.

Option D: This is incorrect because severity levels such as "Informational" are used for categorizing the criticality of events, not for determining whether a rule will block activity. For blocking, the rule's action type must explicitly include "Block."

NEW QUESTION # 297

You are performing a dry run of an automated remediation workflow designed to disable AWS security groups that allow unrestricted inbound traffic.

Which step ensures that the dry run accurately evaluates the workflow without impacting resources?

- A. Deploy the workflow to a non-production environment for testing.
- **B. Enable "Dry Run Mode" in Falcon Fusion to simulate actions without applying them.**
- C. Temporarily revoke permissions to ensure the workflow cannot make changes.
- D. Use CloudTrail logs to manually verify the workflow actions post-execution.

Answer: B

Explanation:

Option A: Enabling "Dry Run Mode" in Falcon Fusion is the correct step for simulating workflow actions without making changes to the actual resources. This mode allows you to verify that the workflow logic functions as expected, including detecting findings and simulating remediation steps, without impacting live environments.

Option B: Revoking permissions may prevent accidental changes, but it does not allow you to test the workflow logic fully, as the dry run mode simulates actions while still validating permissions.

Option C: While testing in a non-production environment is a valid practice, it is not equivalent to a dry run, which explicitly avoids making changes.

Option D: Reviewing logs is important for auditing, but it does not replace the need for a dry run, which provides upfront validation without impacting resources.

NEW QUESTION # 298

When configuring a cloud account using APIs in CrowdStrike, which of the following is the correct first step to ensure the account is successfully registered and operational in the CrowdStrike Falcon platform?

- **A. Generate an API client ID and secret in the CrowdStrike Falcon console.**
- B. Use the CrowdStrike API to configure granular IAM policies before registration.
- C. Assign full administrator access to the CrowdStrike service account in the cloud provider.
- D. Directly input the cloud provider's credentials into the CrowdStrike console.

Answer: A

Explanation:

Option A: Using the CrowdStrike API to configure granular IAM policies is a potential task during or after registration, but it is not the initial step. IAM roles and policies should be defined by the cloud provider's configuration tools, not CrowdStrike, as a preliminary task.

Option B: Inputting cloud provider credentials directly into the CrowdStrike console is not a step in the configuration process. Instead, API-based integrations rely on secure token-based authentication, not direct username/password access, to align with best practices for security and scalability.

Option C: Assigning full administrator access to the CrowdStrike service account is unnecessary and violates the principle of least privilege. Only specific permissions (e.g., read-only access for threat detection) are required, and overly broad access increases the attack surface.

Option D: Generating an API client ID and secret is the required first step to enable secure communication between the CrowdStrike Falcon platform and the cloud provider. The client ID and secret are used for authentication when configuring API integrations, ensuring secure access to the cloud account's data. Without this step, the integration cannot proceed.

NEW QUESTION # 299

What is the first step you should take when troubleshooting issues with cloud account registrations?

- A. Immediately reset all user passwords
- **B. Check the email verification process to ensure users receive verification emails**
- C. Disable the account registration feature temporarily

Answer: B

Explanation:

When troubleshooting issues with cloud account registrations in CrowdStrike Falcon Cloud Security, the first step should be to verify the email verification process. Cloud account registration workflows rely on confirmation emails for validation, authorization, and completion of onboarding steps.

If verification emails are delayed, blocked, or misrouted due to email filtering, domain restrictions, or misconfigured mail settings, the registration process can appear to fail even though the underlying configuration is correct. Checking this process is non-disruptive and often resolves the issue quickly.

Resetting user passwords or disabling registration features are intrusive actions that should only be taken after basic validation steps are completed. CrowdStrike best practices emphasize starting with low-impact troubleshooting actions before making broader changes.

Therefore, confirming that users are receiving and completing verification emails is the correct and recommended first step.

NEW QUESTION # 300

You are configuring a new assessment schedule in CrowdStrike Falcon to monitor your organization's cloud security posture. What is the first step you must take to ensure the schedule is correctly set up and functional?

- A. Enable real-time monitoring for all cloud accounts before setting up the schedule.
- **B. Assign permissions to CrowdStrike Falcon for accessing cloud provider APIs.**
- C. Manually tag critical resources to be included in the assessment.
- D. Select the frequency of the assessment, such as daily, weekly, or monthly.

Answer: B

Explanation:

Option A: Real-time monitoring is complementary to scheduled assessments but is not a prerequisite for setting up an assessment schedule. Scheduled assessments operate independently of real-time monitoring.

Option B: Assigning permissions is the foundational step for CSPM setup. It allows Falcon to retrieve the required telemetry and perform posture assessments effectively.

Option C: Tagging resources may be useful for focused assessments, but it is not mandatory.

Falcon automatically evaluates the entire cloud environment by default unless specified otherwise.

Option D: While selecting the frequency is an essential step, it cannot be completed unless the necessary permissions are granted to Falcon for API access. Without these permissions, the assessments cannot run.
