# Reliable F5CAB5 Practice Materials | F5CAB5 Accurate Test

If you want to get a desirable opposition and then achieve your career dream, you are a right place now. Our F5CAB5 Study Tool can help you pass the exam. So, don't be hesitate, choose the F5CAB5 test torrent and believe in us. Let's strive to our dreams together. Life is short for us, so we all should cherish our life. The F5CAB5 test torrent can let users in a short time, accurately grasp the proposition trend of each year, doing all effects in the process of the difficulties in the hot, user's weak link and targeted training, and exercise the user's solving problem ability, eventually achieve the objectives of the pass BIG-IP Administration Support and Troubleshooting qualification test.

The pass rate for F5CAB5 training materials is 98.65%, and you can pass the exam just one time if you choose us. We have a professional team to collect and research the first-hand information for the exam, and therefore you can get the latest information if you choose us. In addition, F5CAB5 exam materials cover most of knowledge points for the exam, and you can pass the exam as well as improve your professional ability in the process of learning. We have online and offline service. If you have any questions for F5CAB5 Exam Braindumps, and you can contact with us, and we will give you reply as soon as possible.

>> Reliable F5CAB5 Practice Materials <<

F5 F5CAB5 Web-Based Practice Test Software Works without Installation

Our F5CAB5 exam torrent has a high quality that you can't expect. I think our BIG-IP Administration Support and Troubleshooting prep torrent will help you save much time, and you will have more free time to do what you like to do. I can guarantee that you will have no regrets about using our F5CAB5 Test Braindumps When the time for action arrives, stop thinking and go in, try our F5CAB5 exam torrent, you will find our products will be a very good choice for you.

F5 BIG-IP Administration Support and Troubleshooting Sample Questions (Q29-Q34):

NEW QUESTION # 29
A set of servers is used for an FTP application as well as an HTTP website via separate BIG-IP Pools. The server support team reports that some servers are receiving a lot more traffic than others. Which Load Balancing Method should the BIG-IP Administrator apply to even out the connection count?

- A. Least Connections (Node)
- B. Least Connections (Member)
- C. Ratio (Node)
- D. Ratio (Member)

Answer: A

Explanation:
When load balancing is not working as expected across hardware hosting multiple services, the administrator must distinguish between "member" and "node" level algorithms102102102102. A "member" is a specific IP and port (e.g., 10.1.1.1:80), while a "node" is the physical server's IP (10.1.1.1) regardless of the port103. If servers host both FTP and HTTP services in separate pools, using "Least Connections (Member)" only balances connections within each individual pool. This can lead to a skewed distribution where one server is selected for a new HTTP connection because it has the fewest HTTP connections, even if it is

currently overloaded with hundreds of FTP connections. By applying "Least Connections (Node)," the BIG-IP tracks the total number of connections to the physical hardware across all ports and pools106106106106. This ensures that the administrator can maintain an even distribution of the total workload across the server fleet, resolving the reports of uneven traffic distribution reported by the server support team

NEW QUESTION # 30

A Virtual Server uses an iRule to send traffic to pool members depending on the URI. The BIG-IP Administrator needs to modify the pool member in the iRule. Which event declaration does the BIG-IP Administrator need to change to accomplish this?

- A. HTTP_RESPONSE
- B. SERVER_CONNECTED
- C. HTTP_REQUEST
- D. CLIENT_ACCEPTED

Answer: C

Explanation:
Comprehensive and Detailed Explanation From BIG-IP Administration Support and Troubleshooting documents: In F5 TMOS administration, the traffic flow is processed through specific event huddles w3ithin iRules. To troubleshoot or m4odify traffic based on a URI (Uniform Resource Identifier), the BIG-IP system must first parse the application-layer data. The HTTP_REQUEST event is triggered when the system has fully received and parsed the HTTP request headers from the client5. This is the correct point to implement logic that selects a pool or pool member based on the path or file requested (e.g., /images or /api). Using CLIENT_ACCEPTED would be too early in the troubleshooting process because that event triggers at the L4 (TCP) connection establishment phase, before any URI information is available6. Conversely, HTTP_RESPONSE occurs during the return traffic from the server, which is too late to make a load balancing decision7. For troubleshooting virtual server behavior where URIs are involved, ensuring the iRule is attached to a Virtual Server with an HTTP profile and using the HTTP_REQUEST event is essential for proper traffic steering and inspection.

NEW QUESTION # 31

A BIG-IP Administrator makes a configuration change to a Virtual Server on the Standby device of an HA pair. The HA pair is currently configured with Auto-Sync Enabled. What effect will the change have on the HA pair configuration?

- A. The change will be propagated next time a configuration change is made on the Active device.
- B. The change will be undone when Auto-Sync propagates the config to the HA pair.
- C. The change will be undone next time a configuration change is made on the Active device.
- D. The change will take effect when Auto-Sync propagates the config to the HA pair.

Answer: D

Explanation:
Understanding High Availability (HA) synchronization behavior is critical for maintaining a stable environment. In a device group where "Auto-Sync" is enabled, the BIG-IP system monitors the management plane for any configuration updates across all members. While best practices often suggest making changes on the "Active" device, TMOS allows changes on any device within the group. When a change is made on the "Standby" device, the system detects a configuration mismatch and, because Auto-Sync is enabled, it automatically pushes those changes to the other devices in the sync group, including the current Active member. To troubleshoot if this is working correctly, the administrator should review the "Sync Status" stats in the Configuration Utility. If the changes do not propagate, it suggests9 a breakdown i10n the HA trust relationship or network connectivity issues on the failover VLAN. Proper interpretation of this scenario confirms that the HA functionality is operating correctly, ensuring that both devices have a consistent set of virtual servers and pools, which is vital fl1or seamless failover.

NEW QUESTION # 32

A BIG-IP Administrator notices that one of the servers that runs an application is NOT receiving any traffic. The BIG-IP Administrator examines the configuration status of the application and observes the displayed monitor configuration and affected pool member status.

What is the possible cause of this issue? (Choose one answer)

- A. HTTP 1.1 is NOT appropriate for monitoring purposes.
- B. The application is NOT responding with the expected Receive String.
- C. The node health monitor is NOT responding.
- D. The BIG-IP device is NOT able to reach the pool.

Answer: C

Explanation:
The key clue in the exhibit is the pool member's availability showing "Offline (Enabled) - Parent down". In BIG-IP terminology, a pool member inherits the status of its parent node. If the node is marked down (for example, by a node-level monitor or a default "node is down" condition), then all pool members using that node IP will also be marked down and will not receive any traffic, even if the application service on the member port might be healthy.
While the HTTPS monitor configuration (send/receive strings) is displayed, the status specifically indicates a node (parent) failure, not a service-level failure. If the problem were the application not matching the receive string, you would typically see the member down due to the member's monitor failing (and the status would reflect monitor failure details), rather than "parent down." Option D is too broad; BIG-IP can generally reach the subnet (other servers work), and this symptom points to a specific node condition. Option C is incorrect because HTTP/1.1 is commonly used for monitoring and is valid when properly formatted (especially with a Host header). Therefore, the most likely cause is that the node health monitor is not responding, causing the node-and consequently the member-to be marked down.

NEW QUESTION # 33
A BIG-IP Administrator creates a new Virtual Server. The end user is unable to access the page. During troubleshooting, the administrator learns that the connection between the BIG-IP system and server is NOT set up correctly. What should the administrator do to solve this issue?

- A. Disable Address Translation
- B. Set Address Translation to SNAT and have self-IP configured in the same subnet of servers
- C. Set Address Translation to Auto Map, configure a SNAT pool, and have pool members in the same subnet of the servers
- D. Set Address Translation to SNAT and configure a specific translation address

Answer: D

Explanation:
When a virtual server is not working as expected despite the pool members being marked "UP" (Green), the issue is frequently a return-path routing failure. If the BIG-IP forwards a request with the original client's source IP address, the backend server will try to respond directly to that client. If the server does not have its default gateway pointed back to the BIG-IP, the response packet will be routed elsewhere (or dropped), resulting in a connection timeout for the user. To resolve this, the administrator must configure "Source Address Translation" (SNAT). By setting SNAT to "Automap" or a specific SNAT address, the BIG-IP replaces the client's IP with its own internal self-IP. The backend server then sees the BIG-IP as the source and sends the response back to it locally. This troubleshooting step ensures a functional, symmetric tr18affic flow. Identifying the need for SNAT is one of the most common troubleshooting tasks for new virtual server deployments where the BIG-IP is not the default gateway for the backend servers.

NEW QUESTION # 34

......

Providing our customers with up to 1 year of free F5 F5CAB5 questions updates is also our offer. These F5 F5CAB5 free dumps updates will help you prepare according to the latest F5CAB5 test syllabus in case of changes. 24/7 customer support is available at PrepAwayPDF to assist users of the F5CAB5 Exam Questions through the journey. Above all, PrepAwayPDF also offers a full refund guarantee (terms and conditions apply) to our customers. Don't miss these amazing offers. Download F5CAB5 actual exam Dumps today!
