## New AP-202 Braindumps | Valid AP-202 Exam Guide

Overall, AP-202 is committed to helping candidates achieve success in the Salesforce AP-202 exam. Their goal is to save students time and money, and they guarantee that candidates who use their product will pass the AP-202 Exam on their first try. With the right study material and support team, passing the exam at the first attempt is an achievable goal.

## Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q32-Q37):

### NEW QUESTION # 32

Which two statements are accurate?

- A. An Aura component can contain a Lightning Web Component which contains an Aura component
- **B. A Lightning Web Component can contain an Aura component**
- **C. An Aura component can contain a Lightning Web Component**
- D. A Lightning Web Component cannot contain an Aura component

**Answer: B,C**

Explanation:

A Lightning Web Component can contain an Aura component, and an Aura component can contain a Lightning Web Component. This interoperability allows for a smoother transition from Aura to LWC and enables developers to utilize the strengths of both frameworks. However, nesting a Lightning Web Component within an Aura component which in turn contains a Lightning Web Component (Option C) is not a standard practice. For more information, refer to the Salesforce documentation on using Aura and Lightning Web Components together: Salesforce Aura and LWC Interoperability Documentation.

### NEW QUESTION # 33

Which two statement are true for Mass Order (2 answers)

- A. Mass Order pricing is done via a batch job.
- B. Mass Order is mobile ready with the ccrz templates.
- C. Mass order works with the default wishlists
- D. The variation product is leveraged for SKUs.

**Answer: A,D**

Explanation:

Mass Order pricing is done via a batch job, which means that the prices are not calculated in real time, but rather at a scheduled time. Mass order works with the variation product, which is a product that has multiple SKUs with different attributes, such as size or color. Mass order does not work with the default wishlists, which are used to store products that the customer wants to buy later. Mass order is not mobile ready with the ccrz templates, which are the default templates for the storefront pages. #### NEW QUESTION # 34

Which wire adapter should a developer use to retrieve metadata about a specific picklist?

- A. getPicklistMetadataValues
- B. getPicklistMetadata
- C. getPicklistValues
- D. getPicklist

**Answer: C**

Explanation:

To retrieve metadata about a specific picklist, a developer should use the getPicklistValues wire adapter. The getPicklistValues wire adapter imports data from the @salesforce/ui-api module and returns an object that contains information such as the picklist's label, value, default value, validity, and controlling field values. The getPicklistMetadataValues wire adapter does not exist. The getPicklistMetadata wire adapter does not exist either. The getPicklist wire adapter does not exist either. Salesforce [Lightning Web Components Developer Guide: getPicklistValues], [Lightning Web Components Developer Guide: Import User Interface API]

#### NEW QUESTION # 35

A developer needs to make a call to a long running web service which is critical to finalizing their checkout process. Which three items should the developer consider in their implementation?

- A. new Named Credential may need to be created in Setup
- B. Requests to the service should be brokered to prevent limit exceptions
- C. A new CORS entry may need to be created in Setup
- D. A new Remote Site may need to be created in Setup
- E. An Apex method returning a Continuation will need to be created

**Answer: A,C,E**

Explanation:

A developer needs to make a call to a long running web service which is critical to finalizing their checkout process. The developer should consider the following items in their implementation:

A new CORS entry may need to be created in Setup. CORS stands for Cross-Origin Resource Sharing, which is a mechanism that allows web browsers to make requests to servers on different domains. If the web service is hosted on a different domain than the B2B Commerce site, the developer may need to add a CORS entry in Setup to allow the browser to access the web service. This entry specifies the origin, path, and method of the request, as well as any headers or cookies that are allowed<sup>1</sup>.

A new Named Credential may need to be created in Setup. A Named Credential is a type of metadata that stores the URL and authentication settings of a web service. By using a Named Credential, the developer can avoid hardcoding the web service URL and credentials in their code, and instead reference the Named Credential by name. This makes the code more secure and easier to maintain<sup>2</sup>.

An Apex method returning a Continuation will need to be created. A Continuation is a special type of Apex object that allows the developer to make asynchronous calls to long running web services. By using a Continuation, the developer can avoid blocking the main thread and improve the user experience. A Continuation method must return a Continuation object, specify the web service

URL and parameters, and register a callback method that handles the response<sup>3</sup>.

Option D and Option E are incorrect because they are not relevant to the scenario. Option D suggests that the developer should broker the requests to the web service, which means to use an intermediary service that manages the requests and responses. This may be useful for some scenarios, but it is not required for making a call to a long running web service. Option E suggests that the developer should create a new Remote Site in Setup, which is a way to whitelist the domains that can be accessed from Apex code. However, this is not necessary if the developer uses a Named Credential, which automatically handles the Remote Site setting<sup>2</sup>. Reference:

Set Up CORS

Named Credentials

Continuation Class

### NEW QUESTION # 36

A developer is trying to integrate a new shipping provider to use during checkout in a storefront Which two steps must the developer take to make an integration available for selection?

- A. Enter the integration class name and version in the store administration.
- **B. Create an Apex class that uses the integration framework.**
- C. Modify the StoreIntegratedService to map to an Apex class ID using Workbench.
- **D. Create a RegisteredExternalService record using Workbench.**

**Answer: B,D**

Explanation:

To make an integration available for selection, a developer must create a RegisteredExternalService record using Workbench and create an Apex class that uses the integration framework. Creating a RegisteredExternalService record using Workbench allows the developer to register their custom integration class as an external service in Salesforce B2B Commerce. The RegisteredExternalService record contains information such as the class name, version, display name, description, and category of the integration class. The category determines where and how the integration class can be used in B2B Commerce, such as ShippingService or TaxService. Creating an Apex class that uses the integration framework allows the developer to define custom logic for integrating with an external service provider's API or service. The integration framework provides interfaces and classes for various types of integrations, such as shipping, tax, payment, inventory, and freight. The developer can implement these interfaces and classes in their custom Apex class and override their methods with their own logic. Modifying the StoreIntegratedService to map to an Apex class ID using Workbench is not a required step for making an integration available for selection, as it is only used for registering internal services that are provided by Salesforce B2B Commerce out-of-the-box. Entering the integration class name and version in store administration is not a required step either, as it is only used for selecting an existing integration class that has already been registered as an external service. Salesforce [B2B Commerce Developer Guide: Integration Framework], [B2B Commerce Developer Guide: RegisteredExternalService Object]

### NEW QUESTION # 37

.....

Our company always feedbacks our candidates with highly-qualified AP-202 study guide and technical excellence and continuously developing the most professional AP-202 exam materials. You can see the high pass rate as 98% to 100%, which is unmatched in the market. What is more, our AP-202 Practice Engine persists in creating a modern service oriented system and strive for providing more preferential activities for your convenience.
