More importantly, we will promptly update our JN0-224 quiz torrent based on the progress of the letter and send it to you. 99% of people who use our JN0-224 Quiz torrent has passed the exam and successfully obtained their certificates, which undoubtedly show that the passing rate of our JN0-224 exam question is 99%. So our JN0-224 study guide is a good choice for you.

Juniper Automation and DevOps, Associate (JNCIA-DevOps) Sample Questions (Q41-Q46):

NEW QUESTION # 41
Which Python operator is used to test if two variables are equal?

- A. %
- B. =
- C. ==
- D. !=

Answer: C

Explanation:
In Python, the == operator is used to test whether two variables are equal. It returns True if the variables are equal and False if they are not.
Option B (==) is correct because it is the equality operator in Python.
Option A (!=) is used for inequality, Option C (%) is the modulus operator, and Option D (=) is used for assignment, not for testing equality.
Supporting Reference:
Python Documentation on Operators: The official Python documentation covers the use of == for equality checks.

NEW QUESTION # 42
Which feature is used in XML to ensure that all attributes and elements have unique names?

- A. XPath
- B. selectors
- C. namespace
- D. predicate

Answer: A

NEW QUESTION # 43
Which two PyEZ object methods are included by default when using a Python context manager? (Choose two.)

- A. pdiff() and diff()
- B. lock () and unlock (>
- C. |load() and commit ()
- D. open() and close()

Answer: B,D

Explanation:
When using a Python context manager with Junos PyEZ, two key methods are automatically included:
open() and close(): These methods are used to establish and terminate a connection to a Junos device. When you use a context manager (the with statement), open() is called when entering the block, and close() is called when exiting, ensuring the connection is properly managed.
lock() and unlock(): These methods are used to lock the configuration database to prevent other users from making changes while you are working on it. When using a context manager, lock() is called at the start of the block, and unlock() is called at the end, ensuring safe configuration changes.
Supporting Reference:
Junos PyEZ Documentation: The documentation explains how context managers work in PyEZ, including the automatic invocation of open(), close(), lock(), and unlock() methods.

NEW QUESTION # 44
Which statement about the NETCONF content layer is true?

- A. It uses XML for RPC request and response payloads.
- B. It uses HTML for RPC request and response payloads.
- C. It uses JSON for RPC request and response payloads.
- D. It uses YAML for RPC request and response payloads.

Answer: A

NEW QUESTION # 45
Which type of on-box automation script is designed to run every time a user executes a configuration change?

- A. event
- B. operation
- C. SNMP
- D. commit

Answer: D

Explanation:
In Junos OS, a commit script is an on-box automation script that runs every time a configuration change is committed. Commit scripts are used to enforce configuration policies, validate configuration changes, or make automatic adjustments to configurations when certain conditions are met.

Commit Script (C): Executes automatically during the commit process, ensuring that the new configuration adheres to specific rules or conventions before it is applied to the system.

Event, SNMP, and operation scripts are used for other purposes in Junos automation but do not run automatically with every configuration change.

Reference:

Junos OS Automation Scripts Guide: Provides details on different types of scripts, including commit scripts, and their use cases.

Juniper Networks Documentation: Offers examples and best practices for creating and using commit scripts.

NEW QUESTION # 46
