시험준비에 가장 좋은 Drupal-Site-Builder최고품질 인증 시험 기출문제 공부문제

IT업계 종사자라면 누구나 Acquia 인증 Drupal-Site-Builder 시험을 패스하고 싶어하리라고 믿습니다. 많은 분들이 이렇게 좋은 인증 시험은 아주 어렵다고 생각합니다. 네 맞습니다. 패스할 확율은 아주 낮습니다. 노력하지 않고야 당연히 불가능한 일이 아니겠습니까? Acquia 인증 Drupal-Site-Builder 시험은 기초 지식 그리고 능숙한 전업지식이 필요합니다. PassTIP는 여러분들한테 Acquia 인증 Drupal-Site-Builder 시험을 쉽게 빨리 패스할 수 있도록 도와주는 사이트입니다. PassTIP의 Acquia 인증 Drupal-Site-Builder 시험 관련 자료로 여러분은 짧은 시간내에 간단하게 시험을 패스할 수 있습니다. 시간도 절약하고 돈도 적게 들이는 이런 제안은 여러분들한테 딱 좋은 해결책이라고 봅니다.

최신 Drupal 10/11 Drupal-Site-Builder 무료 샘플 문제 (Q26-Q31):

질문 # 26

Users are complaining that listing pages with a large number of images are loading very slowly. On reviewing this you found that full-sized images are loaded while displaying thumbnails.

How will you ensure that smaller sized images are used as thumbnails?

- A. Use CSS to resize the images.
- B. Enable the "Optimize images" option on the Performance administration page.
- C. Use an image style to resize the images.
- D. Use JavaScript to resize the images.

정답: C

설명:

In Drupal 10 and Drupal 11, the correct way to display resized images (such as thumbnails) is by using Image Styles. Image styles

allow Drupal to generate derivative images with specific dimensions (e.g., thumbnail size) and serve those instead of the original full-sized image. This significantly improves performance because smaller image files are loaded, reducing page load time and bandwidth usage.

Drupal's Image module documentation explains that image styles can apply effects such as scaling, cropping, and resizing, and are typically used in Views or field display settings to ensure appropriately sized images are rendered.

Options C and D (JavaScript and CSS resizing) only change how images appear visually but still load the full-size image, which does not improve performance. Option A refers to performance settings but does not specifically handle image resizing.

Therefore, using an image style is the correct, recommended, and documented approach for optimizing image display and improving site performance.

질문 # 27

You wish to display the "Recent content" block in the sidebar region on all the article pages only. The block should be hidden on all other pages.

How do you accomplish this?

- A. In the Block layout settings, add the Recent content block to the Sidebar section and set the block to be visible for the "Article" Content type.
- B. Check the "show recent content" option in the site branding block, and set it to be visible only for Article Content type.
- C. Edit Article Content type and check the "show recent content" option.
- D. Add the Recent content block to all pages, and hide it from non-Article pages using CSS.

정답: A

설명:

Drupal 10 and Drupal 11 provide block visibility conditions that allow administrators to control where blocks appear. According to Drupal's block system documentation, when placing a block through Structure # Block layout, you can configure visibility based on content types, pages, roles, or request paths.

To meet the requirement of showing the "Recent content" block only on Article pages, the correct approach is to place the block in the Sidebar region and configure its visibility condition to Content types # Article. This ensures the block is displayed only when viewing nodes of the Article content type and hidden elsewhere.

Option A is incorrect because using CSS to hide blocks is not a proper Drupal configuration and still renders the block unnecessarily. Options B and C are invalid because Drupal does not provide such settings in content type or site branding configurations.

Thus, using block visibility settings tied to the Article content type is the correct and recommended method in Drupal site building.

질문 # 28

An audit of a corporate Drupal website revealed that a lot of user accounts are being created on the site, with the status "blocked".

The site was initially set up to allow editors to self-register with additional administrator approval. However, the audit revealed that robots are creating a lot of user accounts and administrators are not able to keep up with the approval process.

How can we eliminate fake user registration?

- A. Change who can register accounts to "Administrators only."
- B. Hide user login by disabling the login block and/or move the login page.
- C. Configure new user accounts to "require email verification when a visitor creates an account."
- D. Enable the Drupal core captcha field on the user registration form.

정답: D

설명:

The most effective and Drupal-recommended way to prevent automated (bot-driven) user registrations is to implement a challenge-response mechanism such as CAPTCHA. In Drupal 10 and Drupal 11, this is achieved using the CAPTCHA module (often paired with reCAPTCHA), which integrates directly into forms like user registration. By enabling a CAPTCHA field on the registration form, bots are prevented from submitting automated requests because they cannot solve the challenge, while legitimate users can proceed normally.

Drupal's security best practices emphasize mitigating automated abuse at the form level rather than relying solely on post-registration controls. Option A (email verification) still allows bots to create accounts and flood the system, even if they cannot activate them. Option C (hiding login) does not affect registration endpoints and provides no real protection. Option D (restricting registration to administrators only) eliminates self-registration entirely, which may not meet business requirements and is not a balanced solution. Therefore, enabling CAPTCHA directly addresses the root cause-automated submissions-making it the most appropriate and

scalable solution according to Drupal security guidelines.

질문 # 29

You have created a new Article node with a title, an image and a body field. Your site is configured to use Drupal's core search. If you search for a phrase which is used in your new article, the article is not returned in the search results. Search is otherwise working correctly.

Why is your article not appearing in the search results?

- A. The core search module must be configured to recognize the search term.
- B. Drupal core search does not work very well, and you should use a contributed module for search instead.
- C. You did not check the "Add to search index" checkbox when creating your article.
- D. Cron has not run since you added the article, so Drupal has not indexed the new article yet.

정답: D

설명:

Drupal core search does not index newly created or updated content immediately in the default workflow.

According to the official Drupal core Search module overview , content actions such as creating, editing, or deleting content automatically mark the affected content items for indexing or reindexing at the next cron run

. Until cron runs, the new or changed content is not updated in the search index, so a newly created article may not appear in search results even though search is otherwise functioning correctly.

This makes option C the correct answer. The other options do not match Drupal core behavior. There is no normal site-building step where you configure core search to "recognize" a specific term, and Drupal does not provide an "Add to search index" checkbox when creating an article in core search. Also, while contributed search solutions exist, the question states that Drupal core search is already working correctly, so the missing result is best explained by indexing timing, not by a flaw requiring another module. Drupal's search documentation is explicit that cron is responsible for updating the index after content changes.

질문 # 30

While building a new site, you are working with the default frontend theme. You have placed custom blocks in available regions.

After some time, you decide to install a new contributed theme, and set it as the default for the site.

After switching to the new theme, you notice that many of your blocks have disappeared!

What is the likely reason for this?

- A. The new theme's regions have different names from the regions in the old theme. Those blocks have been disabled.
- B. The blocks were built in such a way that they are not compatible with the new theme. They need to be re-created.
- C. The new theme only allows system blocks, not custom blocks.
- D. The blocks have not yet been registered with the new theme.

정답: A

설명:

In Drupal 10 and Drupal 11, block placement is defined per theme . The Block Layout documentation explains that when placing a block, you are assigning it to a region in a specific theme , not globally for all themes. So when you switch the site's default theme, the new theme may have a different set of regions or different region names, and block placements from the previous theme may no longer map correctly.

Drupal's theming documentation is even more explicit: if a theme does not define a region that blocks were assigned to, those blocks are treated as assigned to an invalid region and are disabled . The Block module documentation also states that disabled blocks (blocks not assigned to any region in your theme) are never shown . This is exactly why blocks can appear to "disappear" after changing themes.

The other options do not match Drupal's documented behavior. Blocks do not need to be "registered" with a theme in this sense, contributed themes are not limited to system blocks, and custom blocks generally do not need to be recreated just because the theme changed. The issue is the theme-specific region mapping , which makes D the correct answer.
