JN0-232 Real Exam Answers | Hot JN0-232 Spot Questions

Now as you have the best test study material from Pass4cram, you must start with the process of learning. Hard work always pays off and there is no chance to fail the JN0-232 exam if you are fully prepared with Pass4cram PDF questions. There is no way that your preparation with real Security, Associate (JNCIA-SEC) (JN0-232) questions PDF shall disappoint you.

Juniper Security, Associate (JNCIA-SEC) Sample Questions (Q36-Q41):

NEW QUESTION # 36

A new packet arrives on an interface on your SRX Series Firewall that is assigned to the trust security zone. In this scenario, how does the SRX Series Firewall determine the egress security zone?

- A. by examining the destination port
- B. by examining the ingress security zone properties
- C. by performing a session lookup
- D. by performing a route lookup

Answer: D

Explanation:

When a new packet arrives that does not match an existing session, the SRX performs full flow-based processing. After ingress zone determination, the firewall must know the destination zone to evaluate security policies.

- * The SRX determines the egress zone by performing a route lookup on the packet's destination IP address.
- * The routing decision identifies the outgoing interface, and the zone associated with that interface becomes the egress zone.
- * Session lookup (Option A) happens first but is only useful for existing sessions.
- * Destination port (Option B) is used for application identification, not zone determination.
- * Ingress zone properties (Option D) cannot determine the egress zone.

Reference: Juniper Networks - SRX Series Flow Processing and Security Zone Determination, Junos OS Security Fundamentals.

NEW QUESTION # 37

Which two statements are correct about unified security policies on SRX Series Firewalls? (Choose two.)

- A. Unified security policies with multiple matches use the most restrictive match.
- B. Unified security policies can be zone-based or global.
- C. Unified security policies use the application identification (AppID) engine.
- D. Unified security policies match applications before processing policy statements.

Answer: B,C

Explanation:

Unified security policies integrate traditional zone-based policies with application-based policies. Their characteristics include:

- * Zone-based or global (Option B): Unified policies can be applied as either zone-specific or global policies.
- * AppID engine (Option C): They leverage the AppID engine for application identification, enabling fine-grained control at the application layer.
- * Policy matching (Option A): Policies are evaluated sequentially like standard security policies; applications are not matched before policy processing.
- * Multiple matches (Option D): If multiple policies could match, the first match applies (sequential order), not the "most restrictive."

Correct Statements: B and C Reference: Juniper Networks - Unified Security Policies and AppSecure Integration, Junos OS Security Fundamentals.

NEW QUESTION # 38

Click the Exhibit button.

The exhibit shows a table representing security policies from the trust zone to the untrust zone.

In this scenario, which two statements are correct? (Choose two.)

- A. FTP requests from the source IP address of 172.25.11.11 are denied to the destination IP address of 10.1.0.10.
- B. SSH requests from the source IP address of 172.25.11.10 are permitted to the destination IP address of 10.1.0.10.
- C. FTP requests from the source IP address of 10.1.0.10 are permitted to the destination IP address of

172.25.11.100.

- D. Ping command requests from the source IP address of 172.25.11.100 are denied to the destination IP address of 10.1.0.10.

Answer: A,B

Explanation:

Juniper SRX evaluates security policies sequentially from top to bottom. Once a policy match is found, no further policies are evaluated. In this exhibit:

* First Policy (FTP, deny):

* Source: 172.25.11.0/24

* Destination: 10.1.0.0/16

* Application: FTP

* Action: deny#Any FTP traffic from 172.25.11.0/24 to 10.1.0.0/16 is denied.

* Second Policy (SSH, permit):

* Same source/destination but application = SSH

* Action = permit#SSH traffic from 172.25.11.0/24 to 10.1.0.0/16 is permitted.

* Third Policy (HTTPS, permit)#HTTPS from the same source/destination is permitted.

* Fourth Policy (Ping, permit):

* Source: 172.25.11.0/24 to any destination

* Application: ping

* Action: permit#ICMP echo requests (ping) from 172.25.11.0/24 to any destination are permitted.

* Fifth Policy (any # any, deny)#Serves as a default deny all at the end.

Now checking each option:

* Option A: SSH from 172.25.11.10 # 10.1.0.10 matches the SSH permit rule (second policy).#Correct.

* Option B: Ping from 172.25.11.100 # 10.1.0.10 matches the ping permit rule (fourth policy). This traffic is permitted, not denied.#Incorrect.

* Option C: FTP from 10.1.0.10 # 172.25.11.100 is reverse traffic (untrust to trust). The table applies only trust # untrust, so this policy does not apply.#Incorrect.

* Option D: FTP from 172.25.11.11 # 10.1.0.10 matches the first policy (FTP deny rule).#Correct.

Correct Statements: A, D

Reference: Juniper Networks - Security Policies Evaluation Order, Junos OS Security Fundamentals, Official Course Guide.

NEW QUESTION # 39

You want to verify the effectiveness of Web filtering on the SRX Series Firewall.

How would you accomplish this task?

- A. by installing a local NGWF server
- B. by examining the content filtering policies
- **C. by attempting to access permitted or blocked URLs**
- D. by checking the file extensions of blocked content

Answer: C

Explanation:

The simplest and most direct method of verifying Web filtering effectiveness is to attempt to access permitted and blocked URLs.

* Option A: Installing a local NGWF server is not required; NGWF queries Juniper's cloud.

* Option B: File extension checking applies to content filtering, not web filtering.

* Option C: Examining policies shows configuration but does not verify enforcement.

* Option D: Correct. Attempting to browse URLs that should be blocked or allowed confirms the Web filtering policy is effective.

Correct Method: Attempt to access permitted or blocked URLs

Reference: Juniper Networks - Verifying Web Filtering Configuration, Junos OS Security Fundamentals.

NEW QUESTION # 40

You have a situation where legitimate traffic is incorrectly identified as malicious by your screen options.

In this scenario, what should you do?

- A. Increase the sensitivity of the screen options.
- **B. Use the alarm-without-drop configuration parameter.**

- C. Discard the traffic immediately.
- D. Enable all screen options.

Answer: B

Explanation:

Screen options are used to detect and prevent attacks such as floods, scans, and malformed packets. In some cases, false positives may occur, where legitimate traffic is mistakenly identified as malicious.

* To address this, administrators can configure the alarm-without-drop option (Option D). This setting generates alarms/logs for suspicious traffic without actually dropping it, allowing verification before taking further action.

* Enabling all screen options (Option A) may increase false positives further.

* Discarding traffic immediately (Option B) risks disrupting legitimate communication.

* Increasing sensitivity (Option C) worsens the problem, since false positives would increase.

Correct Action: Use alarm-without-drop to log the traffic without dropping it.

Reference: Juniper Networks - Junos OS Screen Options and Troubleshooting, Junos OS Security Fundamentals.

NEW QUESTION # 41

.....

Three formats of our study material are Juniper JN0-232 PDF Questions, Desktop Practice Test Software, and a Web-Based Practice Exam. We understand that the learning style of every Security, Associate (JNCIA-SEC) (JN0-232) exam applicant is different. Therefore, we offer three formats of JN0-232 Practice Test material. Now every Security, Associate (JNCIA-SEC) (JN0-232) exam candidate can prepare as per his style by selecting the suitable format.
