Exam dbt-Analytics-Engineering Questions Pdf, Test dbt-Analytics-Engineering Cram

For candidates who need to practice the dbt-Analytics-Engineering exam dumps for the exam, know the new changes of the exam center is quite necessary, it will provide you the references for the exam. We will provide you free update for 365 days after purchasing the product of us, so you will know the latest version of dbt-Analytics-Engineering Exam Dumps. What's more, our system will send the latest version to your email box automatically. You just need to receive the version.

dbt Labs dbt Analytics Engineering Certification Exam Sample Questions (Q93-Q98):

NEW QUESTION # 93
Which two are true about version controlling code with Git?
Choose 2 options.

- A. All the code changes along the lifecycle of a project are tracked.
- B. Code can be reverted to a previous state.
- C. Git prevents any sensitive fields from being saved in code.
- D. Git automatically creates versions of files with suffixes.
- E. When bugs are raised, email notifications are automatically sent by Git to repository users.

Answer: A,B

Explanation:
The correct answers are B: All the code changes along the lifecycle of a project are tracked, and E: Code can be reverted to a previous state.
Git is a distributed version control system designed to maintain a complete, chronological history of all code changes. Every commit records who made the change, when it occurred, and what the modification included.
This ensures transparency, reproducibility, and accountability across the development lifecycle, which makes B correct. Git also allows users to revert code to any previous commit, branch, or tag, making E correct as well. This capability is critical for recovering from mistakes, undoing faulty deployments, and ensuring stable releases.
Option A is incorrect because Git does not create file versions with suffixes; instead, it stores changes as snapshots within a repository. File suffixing is not part of Git's functionality.
Option C is incorrect because Git does not automatically send email notifications. Notification mechanisms come from hosting platforms like GitHub, GitLab, or Bitbucket-not from Git itself.
Option D is incorrect because Git does not prevent committing sensitive information. Developers must manually ensure secrets are excluded via .gitignore, secret managers, or pre-commit hooks. Git will store whatever is committed unless prevented through tooling.
Thus, only B and E correctly describe how Git supports version control in analytics engineering and dbt workflows.

NEW QUESTION # 94
You need to override a source description at the model level. How would you achieve this most effectively?

- A. Use the meta configuration in your model file to provide an alternative description.
- B. Utilize a Jinja macro to dynamically construct the description based on specific conditions.
- C. You cannot override a source description directly in the model.
- D. Create a separate column in the source with a model-specific description.

Answer: A

Explanation:
The meta configuration can be used to override source descriptions and other metadata at the model level. However, make sure to check the documentation for your specific dbt version, as the exact way to do this might vary_

NEW QUESTION # 95
Which explanation describes how dbt infers dependencies between models?
Choose 1 option.

- A. .yml configurations for sources and refs are parsed for dependency information.
- B. All source and ref macros are resolved to database objects and dbt queries them for dependencies.
- C. Information is gathered from the use of source and ref macros.
- D. The underlying SQL code is parsed and relationships are created from explicit table references.

Answer: C

Explanation:
The correct answer is A: Information is gathered from the use of source and ref macros.
dbt determines the dependency graph - the DAG - by analyzing calls to ref() and source() inside model SQL files. These macros explicitly declare relationships between models. When a developer writes ref ('orders'), dbt interprets this as: "the current model depends on the orders model." Similarly, source() indicates dependencies on upstream raw data sources. This declarative approach allows dbt to build a structured and deterministic DAG without scanning SQL for implicit table references.
Option B is incorrect because dbt does not query database objects to infer dependencies; it resolves dependencies at compile time through metadata generated from model files. Option C is incorrect because dbt intentionally does not parse SQL to detect table names-this would be brittle and error-prone across warehouses. Instead, dbt requires explicit references to maintain reliability.
Option D is incorrect because YAML files define metadata about models and sources but do not create dependency relationships between them.
Thus, the dependency graph is built exclusively by reading ref() and source() macro calls, which ensures clarity, correctness, and maintainability within the analytics engineering workflow.

NEW QUESTION # 96
Your development environment uses a smaller-scale version of the production warehouse. You often debug issues that depend on data volume, requiring a way to temporarily "scale up" your development environment. Which strategies are feasible?

- A. Dynamically increase resource allocation (CPU, memory) within your data warehouse, if supported.
- B. Run a separate dbt project against production data for testing, but target a staging schema.
- C. Selectively snapshot a subset of production data into your development environment.
- D. Write dbt macros that use temporary tables to simulate larger datasets during development

Answer: A,B,C

Explanation:
A directly addresses the resource limitation, if possible. C offers a controlled way to bring in real data. D creates a sandboxed environment within production. B is clever, but unlikely to be truly representative.

NEW QUESTION # 97
A source table is updated with a full overwrite every night. Your dbt job fails due to freshness checks. What's a likely cause and solution?

- A. The source uses an incremental materialization. Change it to a 'table'
- B. The loaded_at field is absent Add the corresponding column or remove the check-
- C. The freshness check is misconfigured- Adjust the count and period settings.
- D. You need to schedule the dbt job to run after the nightly update.

Answer: C

Explanation:

Freshness checks designed for incremental updates might fail with full overwrites. Other solutions might be needed in specific scenarios but aligning the check is the first step.
