CTFL_Syll_4.0 Latest Mock Exam | CTFL_Syll_4.0 New Dumps Sheet

As you know, there are so many users of our CTFL_Syll_4.0 guide questions. If we accidentally miss your question, please contact us again and we will keep in touch with you. Although our staff has to deal with many things every day, it will never neglect any user. With the development of our CTFL_Syll_4.0 Exam Materials, the market has become bigger and bigger. Paying attention to customers is a big reason. And we believe that with the supports of our worthy customers, our CTFL_Syll_4.0 study braindumps will become better.

ISQI ISTQB Certified Tester Foundation Level (CTFL) v4.0 Sample Questions (Q175-Q180):

NEW QUESTION # 175

Which of the following work products cannot be examined by static analysis?

- A. Compiled code
- B. Source code
- C. Formal models
- D. Test plans

Answer: D

Explanation:

Explanation

Static analysis is the process of examining the work products of a software development or testing activity without executing them. Static analysis can be applied to various types of work products, such as requirements, design, code, test cases, etc. However, test plans are not suitable for static analysis, because they are high-level documents that describe the test objectives, scope, strategy, resources, schedule, and risks of a testing project. Test plans are not executable or formalized in a way that static analysis tools can analyze them.

Therefore, option A is the correct answer.

NEW QUESTION # 176

Which of the following statements best describes how configuration management supports testing?

- A. Configuration management is an administrative discipline that includes change control, which is the process of controlling the changes to identified items referred to as Configuration Items'
- B. Configuration management is an approach to interoperability testing where tests are executed in the cloud, as the cloud can provide cost-effective access to multiple configurations of the test environments
- C. Configuration management helps reduce testing effort by identifying a manageable number of test environment configurations in which to test the software, out of all possible configurations of the environment in which the software will be released
- D. Configuration management helps ensure that all relevant project documentation and software items are uniquely identified in all their versions and therefore can be unambiguously referenced in test documentation

Answer: D

Explanation:

This answer is correct because configuration management is a process of establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design, and operational information throughout its life.

Configuration management helps ensure that all relevant project documentation and software items are uniquely identified in all their versions and therefore can be unambiguously referenced in test documentation. This supports testing by providing traceability, consistency, and control over the test artifacts and the software under test. NEW QUESTION # 177

Consider a given test plan which, among others, contains the following three sections: "Test Scope", "Testing Communication", and "Stakeholders". The features of the test object to be tested and those excluded from the testing represent information that is:

- A. usually included in a test plan and, in the given test plan, it is more likely to be specified within "Test Scope" rather than in the other two sections mentioned
- B. usually included in a test plan and, in the given test plan, it is more likely to be specified within "Stakeholders" rather than in the other two sections mentioned
- C. usually included in a test plan and, in the given test plan, it is more likely to be specified within "Testing Communication" rather than in the other two sections mentioned
- D. not usually included in a test plan, and therefore in the given test plan it should not be specified neither within the three sections mentioned, nor within the others

Answer: A

Explanation:

Explanation

The features of the test object to be tested and those excluded from the testing represent information that is usually included in a test plan and, in the given test plan, it is more likely to be specified within "Test Scope" rather than in the other two sections mentioned. The test scope defines the boundaries and limitations of the testing activities, such as the test items, the features to be tested, the features not to be tested, the test objectives, the test environment, the test resources, the test assumptions, the test risks, etc. The test scope helps to establish a common understanding of what is included and excluded from the testing, and to avoid ambiguity, confusion, or misunderstanding among the stakeholders. The other two sections, "Testing Communication" and "Stakeholders", are also important parts of a test plan, but they do not directly address the features of the test object. The testing communication describes the methods, frequency, and responsibilities for the communication and reporting of the testing progress, status, issues, and results. The stakeholders identify the roles and responsibilities of the people involved in or affected by the testing activities, such as the test manager, the test team, the project manager, the developers, the customers, the users, etc. References: ISTQB Certified Tester Foundation Level (CTFL) v4.0 sources and documents:

NEW QUESTION # 178

Which of the following statements is not correct?

- A. Identifying defects may be perceived as criticism against product
- B. Looking for defects in a system may require Ignoring system details
- C. Testing is often seen as a destructive activity instead of constructive activity
- D. Looking for defects in system requires professional pessimism and curiosity

Answer: B

Explanation:

* Looking for defects in a system does not require ignoring system details, but rather paying attention to them and understanding how they affect the system's quality, functionality, and usability. Ignoring system details could lead to missing important defects or testing irrelevant aspects of the system

* Identifying defects may be perceived as criticism against product, especially by the developers or stakeholders who are invested in the product's success. However, identifying defects is not meant to be a personal attack, but rather a constructive feedback that helps to improve the product and ensure its alignment with the requirements and expectations of the users and clients.

* Looking for defects in system requires professional pessimism and curiosity, as testers need to anticipate and explore the possible ways that the system could fail, malfunction, or behave unexpectedly.

Professional pessimism means being skeptical and critical of the system's quality and reliability, while curiosity means being eager and interested in finding out the root causes and consequences of the defects.

* Testing is often seen as a destructive activity instead of constructive activity, as it involves finding and reporting the flaws and weaknesses of the system, rather than creating or enhancing it. However, testing is actually a constructive activity, as it contributes to the system's improvement, verification, validation, and optimization, and ultimately to the delivery of a high-quality product that meets the needs and expectations of the users and clients.

NEW QUESTION # 179

Which of the following coverage criteria results in the highest coverage for state transition based test cases?

- A. Covering all states at least once
- B. Covering all transitions at least once
- C. Covering only start and end states

- D. Can't be determined

Answer: B

Explanation:

Covering all transitions at least once is the highest coverage criterion for state transition based test cases, because it ensures that every possible change of state is tested at least once. This means that all the events that trigger the transitions, as well as the actions and outputs that result from the transitions, are verified. Covering all transitions at least once also implies covering all states at least once, but not vice versa. Therefore, option D is not the highest coverage criterion. Option C is the lowest coverage criterion, because it only tests the initial and final states of the system or component, without checking the intermediate states or transitions. Option A is incorrect, because the coverage criteria for state transition based test cases can be determined and compared based on the number of transitions and states covered. References = CTFL 4.0 Syllabus, Section 4.2.3, page 49-50.

NEW QUESTION # 180

.....

Individuals who pass the ISTQB Certified Tester Foundation Level (CTFL) v4.0 (CTFL_Syll_4.0) certification exam demonstrate to their employers and clients that they have the knowledge and skills necessary to succeed in the industry. PrepAwayPDF is aware that preparing with outdated ISTQB Certified Tester Foundation Level (CTFL) v4.0 (CTFL_Syll_4.0) study material results in a loss of time and money.

CTFL_Syll_4.0 Latest Mock Exam: https://www.prepawaypdf.com/ISQI/CTFL_Syll_4.0-practice-exam-dumps.html

PrepAwayPDF CTFL_Syll_4.0 Latest Mock Exam can satisfy the fundamental demands of candidates with concise layout and illegible outline of our exam questions, ISQI CTFL_Syll_4.0 Sample Test Online Do not worry about it, For most people getting CTFL_Syll_4.0 certification means great opportunity for their career.so how to make a preparation for CTFL_Syll_4.0 test will a big issue for you, You can get the latest information about the CTFL_Syll_4.0 real test, because our PrepAwayPDF will give you one year free update.
