We can make sure that the PDF version of the CCFH-202b Test Questions will be very convenient for all people. Of course, if you choose our CCFH-202b study materials, you will love it.

CrowdStrike Certified Falcon Hunter Sample Questions (Q22-Q27):

NEW QUESTION # 22

How do you rename fields while using transforming commands such as table, chart, and stats?

- A. By renaming the fields with the "rename" command after the transforming command e.g. "stats count by ComputerName | rename count AS total_count"
- B. By using the "renamed" keyword after the field name eg "stats count renamed totalcount by ComputerName"
- C. By specifying the desired name after the field name eg "stats count totalcount by ComputerName"
- D. You cannot rename fields as it would affect sub-queries and statistical analysis

Answer: A

Explanation:

The rename command is used to rename fields while using transforming commands such as table, chart, and stats. It can be used after the transforming command and specify the old and new field names with the AS keyword. You can rename fields as it would not affect sub-queries and statistical analysis, as long as you use the correct field names in your queries. The renamed keyword and the desired name after the field name are not valid ways to rename fields.

NEW QUESTION # 23

Which of the following is a suspicious process behavior?

- A. Non-network processes (eg. notepad.exe) making an outbound network connection
- B. An Internet browser (eg. Internet Explorer) performing multiple DNS requests
- C. PowerShell launching a PowerShell script
- D. PowerShell running an execution policy of RemoteSigned

Answer: A

Explanation:

Non-network processes are processes that are not expected to communicate over the network, such as notepad.exe. If they make an outbound network connection, it could indicate that they are compromised or maliciously used by an adversary. PowerShell running an execution policy of RemoteSigned is a default setting that allows local scripts to run without digital signatures. An Internet browser performing multiple DNS requests is a normal behavior for web browsing. PowerShell launching a PowerShell script is also a common behavior for legitimate tasks.

NEW QUESTION # 24

SPL (Splunk) eval statements can be used to convert Unix times (Epoch) into UTC readable time. Which eval function is correct
