BONUS!!! Download part of Itexamguide 312-50v13 dumps for free: <https://drive.google.com/open?id=1xUEt8h42pIDUc7wFni0DI0RKJpJXZKA>

After you purchase our 312-50v13 learning materials, we will still provide you with excellent service. Our customer service is 24 hours online, you can contact us any time you encounter any problems. Of course, you can also send us an email to contact with us on the 312-50v13 Study Guide. We will reply you the first time. As you know, there are many users of 312-50v13 exam preparation. But we work high-efficiently 24/7 to give you guidance.

Every year, countless ECCouncil aspirants face challenges to prove their skills and knowledge by attempting the ECCouncil 312-50v13 certification exam. Once they pass this examination, lucrative job opportunities in the tech industry await them. But fear not! Itexamguide has got you covered with their collection of real and updated 312-50v13 Exam Questions. These affordable 312-50v13 questions are available in three user-friendly formats, ensuring a smooth and efficient preparation experience for the 312-50v13 exam.

2026 Excellect 312-50v13 Pass Rate | Reliable New 312-50v13 Braindumps Files: Certified Ethical Hacker Exam (CEHv13)

Have similar features to the desktop-based exam simulator. Contains actual ECCouncil 312-50v13 practice test that will help you grasp every topic. Compatible with every operating system. Does not require any special plugins to operate. Creates a 312-50v13 Exam atmosphere making candidates more confident. Keeps track of your progress with self-analysis and Points out mistakes at the end of every attempt.

ECCouncil Certified Ethical Hacker Exam (CEHv13) Sample Questions (Q531-Q536):

NEW QUESTION # 531

What ports should be blocked on the firewall to prevent NetBIOS traffic from not coming through the firewall if your network is comprised of Windows NT, 2000, and XP?

- A. 0
- **B. 1**
- C. 2
- D. 3
- **E. 4**
- **F. 5**

Answer: B,E,F

Explanation:

To block NetBIOS and related Windows networking traffic from traversing a firewall (especially from external sources), you should block the following ports:

- * Port 135 (TCP/UDP): Microsoft RPC endpoint mapper (DCOM/RPC)
- * Port 139 (TCP): NetBIOS Session Service
- * Port 445 (TCP): Direct-hosted SMB over TCP/IP (Windows 2000+)

These ports are commonly used for:

- * File sharing
- * RPC-based communication
- * Windows network services

From CEH v13 Official Courseware:

- * Module 3: Scanning Networks
- * Module 4: Enumeration

CEH v13 Study Guide states:

"To prevent external enumeration, remote file sharing, and NetBIOS attacks, administrators should block inbound access to ports 135, 139, and 445 on the firewall." Incorrect Options:

- * A (110): POP3 mail service
- * D (161): SNMP
- * F (1024): High ephemeral port; not specific to NetBIOS

NEW QUESTION # 532

Chandler works as a pen-tester in an IT firm in New York. As part of detecting viruses in the systems, he uses a detection method where the antivirus executes the malicious code on a virtual machine to simulate CPU and memory activities.

Which type of virus detection method did Chandler use in this context?

- A. Heuristic Analysis
- B. Integrity checking
- **C. Code Emulation**
- D. Scanning

Answer: C

Explanation:

In CEH v13 Module 06: Malware Threats, code emulation is defined as a technique used by modern antivirus software where a virtual CPU and memory are created to safely execute and analyze malware in a sandboxed environment.

This allows the detection engine to observe runtime behavior of suspicious code without risking the actual system.

It's more effective than signature-based detection for catching polymorphic and obfuscated malware.

NEW QUESTION # 533

which of the following information security controls creates an appealing isolated environment for hackers to prevent them from compromising critical targets while simultaneously gathering information about the hacker?

- A. Honeypot
- B. intrusion detection system
- C. BotnetD Firewall

Answer: A

Explanation:

A honeypot may be a trap that an IT pro lays for a malicious hacker, hoping that they will interact with it during a way that gives useful intelligence. It's one among the oldest security measures in IT, but beware:

luring hackers onto your network, even on an isolated system, are often a dangerous game.

honeypot may be a good starting place: "A honeypot may be a computer or computing system intended to mimic likely targets of cyberattacks." Often a honeypot are going to be deliberately configured with known vulnerabilities in situation to form a more tempting or obvious target for attackers. A honeypot won't contain production data or participate in legitimate traffic on your network - that's how you'll tell anything happening within it's a results of an attack. If someone's stopping by, they're up to no good. That definition covers a various array of systems, from bare-bones virtual machines that only offer a couple of vulnerable systems to ornately constructed fake networks spanning multiple servers. and therefore the goals of these who build honeypots can vary widely also , starting from defense thorough to academic research.

additionally , there's now an entire marketing category of deception technology that, while not meeting the strict definition of a honeypot, is certainly within the same family. But we'll get thereto during a moment.

honeypots aim to permit close analysis of how hackers do their dirty work. The team controlling the honeypot can watch the techniques hackers use to infiltrate systems, escalate privileges, and otherwise run amok through target networks. These sorts of honeypots are found out by security companies, academics, and government agencies looking to look at the threat landscape. Their creators could also be curious about learning what kind of attacks are out there, getting details on how specific sorts of attacks work, or maybe trying to lure a specific hackers within the hopes of tracing the attack back to its source. These systems are often inbuilt fully isolated lab environments, which ensures that any breaches don't end in non-honeypot machines falling prey to attacks. Production honeypots, on the opposite hand, are usually deployed in proximity to some organization's production infrastructure, though measures are taken to isolate it the maximum amount as possible. These honeypots often serve both as bait to distract hackers who could also be trying to interrupt into that organization's network, keeping them faraway from valuable data or services; they will also function a canary within the coalpit , indicating that attacks are underway and are a minimum of partially succeeding.

NEW QUESTION # 534

You are trying to break into a highly secure mainframe system at a bank. Conventional hacking doesn't work because of strong technical defenses. You aim to exploit the human element instead.

How would you proceed?

- A. Try to hang around local pubs or restaurants near the bank, get talking to a disgruntled employee, and offer them money for sensitive access
- B. Launch a DDoS attack using thousands of zombies
- C. Conduct a Man-in-the-Middle (MiTM) attack using DNS cache poisoning
- D. Look for zero-day exploits at underground hacker websites and buy them

Answer: A

Explanation:

Comprehensive and Detailed Explanation:

This is a classic example of social engineering. When a system is well-secured technically, attackers often turn to exploiting human vulnerabilities - such as:

- * Talking to employees and gaining their trust
- * Bribing disgruntled or low-level staff
- * Gaining physical access or insider information through manipulation

From CEH v13 Courseware:

- * Module 7: Social Engineering

Incorrect Options:

- * A: Zero-days are rare and expensive; not always feasible.
- * C: DDoS is disruptive, not data-oriented.
- * D: MiTM is a complex network-based attack, unlikely effective against a hardened internal mainframe.

Reference:CEH v13 Study Guide - Module 7: Psychological Approaches to Social EngineeringKevin Mitnick's "The Art of Deception" - Real-world examples of insider targeting

NEW QUESTION # 535

You are trying to break into a highly classified top-secret mainframe computer with highest security system in place at Merclyn Barley Bank located in Los Angeles.

You know that conventional hacking doesn't work in this case, because organizations such as banks are generally tight and secure when it comes to protecting their systems.

In other words, you are trying to penetrate an otherwise impenetrable system.

How would you proceed?

- A. Try to conduct Man-in-the-Middle (MiTM) attack and divert the network traffic going to the Merclyn Barley Bank's Webserver to that of your machine using DNS Cache Poisoning techniques
- B. Look for "zero-day" exploits at various underground hacker websites in Russia and China and buy the necessary exploits from these hackers and target the bank's network
- C. Launch DDOS attacks against Merclyn Barley Bank's routers and firewall systems using 100, 000 or more "zombies" and "bots"
- D. Try to hang around the local pubs or restaurants near the bank, get talking to a poorly-paid or disgruntled employee, and offer them money if they'll abuse their access privileges by providing you with sensitive information

Answer: D

NEW QUESTION # 536

.....

The authoritative, efficient, and thoughtful service of 312-50v13 learning question will give you the best user experience, and you can also get what you want with our 312-50v13 study materials. I hope our study materials can accompany you to pursue your dreams. If you can choose 312-50v13 test guide, we will be very happy. We look forward to meeting you. You can choose your favorite our study materials version according to your feelings. When you use 312-50v13 Test Guide, you can also get our services at any time. We will try our best to solve your problems for you. I believe that you will be more inclined to choose a good service product, such as 312-50v13 learning question. After all, everyone wants to be treated warmly and kindly, and hope to learn in a more pleasant mood.
