Fortinet NSE 5 - FortiSwitch 7.6 Administrator Sample Questions (Q69-

Q74):

NEW QUESTION # 69

What is the role of a device that is simultaneously functioning as both the distribution and core in the hierarchy network model?

- A. FortiGate managing FortiSwitch
- B. POE with high density FortiSwitch
- C. FortiSwitch functioning as standalone
- D. HA backup FortiGate managing FortiSwitch

Answer: A

Explanation:

In a hierarchical network model, the role of a device functioning simultaneously as both the distribution and core is most accurately described as "FortiGate managing FortiSwitch (B)." In this setup, FortiGate acts as the central unit managing multiple FortiSwitch units, thereby functioning both as a distribution layer-handling traffic between network segments-and as a core layer-managing traffic within the network on a broader scale. This setup is typical in medium-sized networks where a single device is capable enough to handle both roles effectively.

NEW QUESTION # 70

Which statement about the configuration of VLANs on a managed FortiSwitch port is true?

- A. FortiSwitch VLAN interfaces are created only when FortiSwitch is managed by Forti-Gate.
- B. Allowed VLANs expand the collision domain to the port.
- C. The native VLAN is implicitly part of the allowed VLAN on the port.
- D. Untagged VLANs must be part of the allowed VLANs: ingress and egress.

Answer: C

Explanation:

The native VLAN is implicitly part of the allowed VLAN on the port (C): On a managed FortiSwitch port, the native VLAN, which is the VLAN assigned to untagged traffic, is implicitly included in the list of allowed VLANs. This means it does not need to be explicitly specified when configuring VLAN settings on the port.

This configuration simplifies VLAN management and ensures that untagged traffic is handled correctly without additional configuration steps.

NEW QUESTION # 71

To enhance service in emergency situations, to which LLDP-MED Type-Length-Values does Forti-Switch advertise to IP phones?

- A. Inventory management
- B. Location
- C. Power management
- D. Network policy

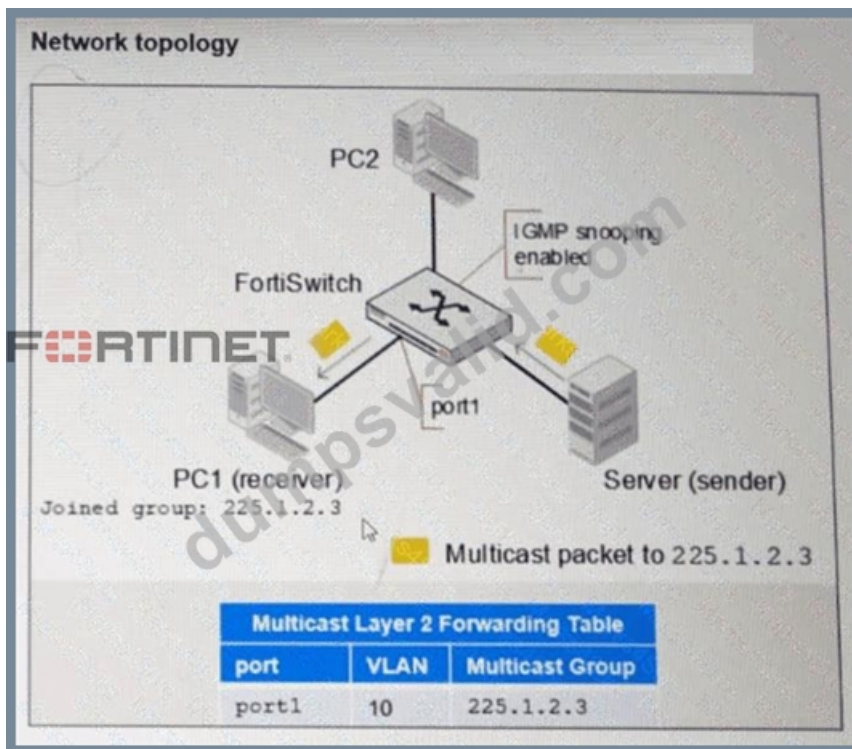

Answer: B

Explanation:

Location (C): FortiSwitch uses LLDP-MED (Link Layer Discovery Protocol - Media Endpoint Discovery) to advertise various attributes to IP phones, among which "Location" is crucial in emergency situations. This information helps emergency responders to determine the physical location of the calling device, which is vital for prompt response in critical situations.

NEW QUESTION # 72

Refer to the exhibit.

PC1 connected to port1 has joined multicast group 225.1.2.3 on VLAN 10 with IGMP snooping enabled. What will happen if you disable IGMP snooping on FortiSwitch? (Choose one answer)

- A. PC1 will be removed from the multicast group 225.1.2.3.
- **B. Multicast traffic for 225.1.2.3 will be flooded to all ports.**
- C. The FortiSwitch will stop processing IGMP report join messages.
- D. Multicast traffic will stop until a multicast receiver is detected.

Answer: B

Explanation:

According to the FortiSwitchOS 7.6 Administration Guide and the FortiSwitch 7.6 Study Guide, Internet Group Management Protocol (IGMP) snooping is a Layer 2 mechanism that allows a switch to "listen" to IGMP conversations between hosts and routers to maintain a map of which ports require specific multicast streams. When IGMP snooping is enabled, the switch populates a Multicast Layer 2 Forwarding Table (as shown in the exhibit), which ensures that multicast traffic is only forwarded to ports where a receiver has explicitly requested it (e.g., PC1 on port1).

When IGMP snooping is disabled, the switch no longer maintains this granular forwarding table. By default, a Layer 2 switch that is not performing IGMP snooping treats multicast traffic as if it were broadcast traffic.

Consequently, instead of being intelligently forwarded only to the interested receiver (PC1), the multicast traffic for group 225.1.2.3 will be flooded to all ports within the same VLAN (VLAN 10). This means PC2, even if it has not joined the group, will receive the multicast packets at the physical layer, leading to unnecessary bandwidth consumption and increased CPU load on unintended recipients.

The documentation explicitly states that disabling IGMP snooping reverts the switch to a "flood-all" behavior for multicast frames within the broadcast domain. Option A is incorrect because the host (PC1) remains a member of the group; only the switch's forwarding logic changes. Option B is incorrect as the switch may still see the messages but will not act on them to prune ports. Option D is incorrect as disabling the feature removes the prune/stop mechanism, causing traffic to flow everywhere rather than stopping.

NEW QUESTION # 73

Exhibit.

port1 and port2 are the only ports configured with the same native VLAN 10.

What are two reasons that can trigger port1 to shut down? (Choose two.)

- A. An endpoint sent a BPDU on port1 that it received from another interface.
- **B. Loop guard frame sourced from port1 was received on port1.**
- **C. port1 was shut down by loop guard protection.**
- D. STP triggered a loop and applied loop guard protection on port1.

Answer: B,C
