Cisco Designing Cisco Security Infrastructure Sample Questions (Q54-Q59):

NEW QUESTION # 54

A video game company identified a potential threat of a SYN flood attack, which could disrupt the online gaming services and impact user experience. The attack can overwhelm network resources by exploiting the TCP handshake process, leading to server unavailability and degraded performance. To safeguard the company's infrastructure and ensure uninterrupted service, it is essential to enhance the security measures in place. The company must implement a solution that manages and mitigates the risk of such network-based attacks. Which security product must be implemented to mitigate similar risks?

- A. Cisco Web Security Appliance
- B. Cisco Umbrella
- C. Cisco Secure Firewall
- D. Cisco Secure Endpoint

Answer: C

Explanation:

A SYN flood attack is a type of DoS/DDoS attack targeting the TCP handshake process. The correct mitigation is deploying a Cisco Secure Firewall, which includes advanced intrusion prevention, SYN flood protection, and traffic management capabilities to prevent resource exhaustion and keep services available.

NEW QUESTION # 55

A developer company recently made a contract with new customer in the financial space. The customer has multiple remote sites and requires a VPN solution with the highest encryption.

Which protocol must be used in IPsec Phase 2?

- A. IKE
- B. SD-WAN
- C. ISAKMP
- D. ESP

Answer: D

Explanation:

In IPsec Phase 2, the Encapsulating Security Payload (ESP) protocol is used to provide confidentiality, integrity, and authentication for VPN traffic. ESP ensures the highest encryption and protection for sensitive financial data across remote sites.

NEW QUESTION # 56

A construction company recently introduced a BYOD policy, where contractors can bring personal devices and connect to the wireless network. The network engineer configured a Wi-Fi network with a guest splash page to provide internet access only. Although the policy was limited to wireless devices, contractors started bringing devices that needed wired connections without authorization and connecting to the network. The network team suggested shutting down ports where unauthorized devices are connected. Which technology must be implemented to ensure that wired and wireless devices are granted network access only after successful authentication?

- A. 802.1x
- B. private VLANs
- C. VACLs
- D. VxLANs

Answer: A

Explanation:

802.1X provides port-based network access control, requiring devices (wired or wireless) to authenticate before gaining network access. This ensures that only authorized users and devices can connect, enforcing the BYOD policy and preventing unauthorized wired connections.

NEW QUESTION # 57

A company hosted multiple applications in the Kubernetes environment, using the naming app01, app02, and so on. An app01 user could access app02 data because no security measures are implemented. The administrator decided to place each application within a separate namespace and ensure that the namespaces are completely isolated and cannot communicate with each other. Which solution must be used to accomplish the task?

- A. Gateway
- B. HTTPRoute
- C. RoleBinding
- D. NetworkPolicy

Answer: D

Explanation:

In Kubernetes, a NetworkPolicy controls communication between pods and namespaces. By applying policies that deny cross-namespace traffic, the administrator can ensure each application (e.g., app01, app02) is isolated and cannot access data from other namespaces.

NEW QUESTION # 58

When designing security for applications distributed across multiple cloud providers, what is a key consideration?

- A. MPLS cloud backbone routing
- B. High-performance DHCP services
- C. Consistent identity and access policies
- D. Local proxy deployment

Answer: C

Explanation:

Consistent identity and access management policies across cloud providers ensure uniform security controls and simplify governance in multi-cloud environments.
