VMware Cloud Foundation 9.0 Administrator Sample Questions (Q75-Q80):

NEW QUESTION # 75
An administrator is tasked with deploying a new VMware Cloud Foundation (VCF) fleet consisting of two VCF instances.
Which two components would the administrator need to install after initial deployment to have a full-stack VCF monitoring solution? (Choose two.)

- A. VCF Operations for Networks
- B. VCF Operations for Logs
- C. VCF Operations
- D. VCF Operations Management Pack Builder
- E. VCF Operations Fleet Management

Answer: A,E

Explanation:
Fleet Management: "VCF Operations Fleet Management enables cross-instance monitoring, unifying health and metrics across multiple VCF instances." Operations for Networks: "Provides application and network visibility, dependency mapping, and traffic analytics. Required to complete full-stack monitoring." Core VCF Operations is already deployed as part of the management stack and does not need to be added separately.
Operations for Logs is optional for log aggregation, not mandatory for full-stack observability.

NEW QUESTION # 76

An administrator has been tasked with creating a custom alert for an object in VMware Cloud Foundation (VCF) Operations. When creating the alert, the administrator completes the following:
- A new symptom definition: Read Latency (ms) is higher than 1 ms.
- A new alert definition: alert is triggered as soon as the latency is higher than the 1 ms defined in the symptom definition.
- Select Virtual Machine (VM) as the Object type.
What additional step must the administrator take to complete the stated objective and ensure the alert is triggered?

- A. Create a new Payload Template.
- B. Create and enable a super metric for read latency in the Active Policy.
- C. Create an instance of the REST Notification Plugin.
- D. Enable the alert in an Active Policy.

Answer: D

NEW QUESTION # 77
Which is the appropriate first action to take to resolve dropped network packets on an ESXi host?

- A. Check physical network switch configuration
- B. Enable Storage I/O Control
- C. Migrate VMs to another data store
- D. Increase the CPU and memory allocation for VMs

Answer: A

Explanation:
Dropped network packets are often caused by misconfigurations or issues at the physical network layer.
Checking the physical network switch configuration is the first step to ensure that the network settings, such as VLANs, uplinks, and port configurations, are correctly set up. This ensures proper connectivity and traffic flow for the ESXi host and the VMs.

NEW QUESTION # 78
An administrator has been tasked with providing audit information from VMware Cloud Foundation (VCF) such as logins and configuration changes in VCF Operations. What must be configured to provide the required information?

- A. Configure Audit logs for every VCF instance.
- B. Enable Event logs in every vCenter server.
- C. Enable Audit Events.
- D. Integrate VCF Operations for Logs.

Answer: D

Explanation:
The VCF 9.0 Logging and Auditing Guide explains that audit information--including user logins, configuration changes, and API requests--is collected and made searchable through VCF Operations for Logs.
VCF Operations for Logs provides centralized log aggregation and auditing for all VCF services, including audit trails of logins and configuration changes.

NEW QUESTION # 79
What is the required update interval for VMware Cloud Foundation (VCF) licenses in connected mode to maintain the entitlement?

- A. 270 days
- B. 180 days
- C. 90 days
- D. 365 days

Answer: B

Explanation:

VCF 9.0 licensing is managed through VCF Operations and the VCF Business Services console. The product requires periodic license updates even in connected mode. The documentation states explicitly: "You must update your licenses at least once every 6 months (180 days). If license usage data is not submitted... your licenses are treated as expired, your hosts are disconnected from the vCenter instance, and you cannot start any workload operations." This language is repeated in the Licensing Overview and Upgrade/Registration sections, confirming the 180-day requirement applies to both connected and disconnected modes (in connected mode usage submission is automated, but you still must perform an update action). Therefore, the correct interval is 180 days.
