WGU Practical Applications of Prompt QFO1 Sample Questions (Q46-Q51):

NEW QUESTION # 46

Which major challenge has been an issue for AI systems?

- A. Processing unstructured data
- **B. Lacking ethical reasoning**
- C. Generating video content
- D. Analyzing vast amounts of data

Answer: B

Explanation:

One of the most significant and persistent challenges in the field of Artificial Intelligence is the lack of inherent ethical reasoning. AI models operate based on mathematical probabilities and patterns found within their training data; they do not possess a moral compass, a sense of justice, or an understanding of social nuances unless specifically programmed or constrained by human-defined rules. This often leads to issues where an AI might generate biased, harmful, or socially insensitive outputs because it is simply reflecting the biases present in its training set without any ethical filter.

While AI is actually quite proficient at analyzing vast amounts of data and is increasingly capable of processing unstructured data and generating video, the "black box" nature of its decision-making makes ethical alignment difficult. Ensuring that an AI respects privacy, avoids discrimination, and adheres to human values requires significant external intervention, such as Reinforcement Learning from Human Feedback (RLHF). The challenge lies in the fact that ethics are often subjective and context-dependent, making it nearly impossible to encode a universal moral code into a machine. This lack of ethical reasoning is why human oversight remains a critical component of AI deployment, especially in high-stakes fields like law, healthcare, and autonomous systems.

NEW QUESTION # 47

What is an example of a prompt that has an appropriate level of specificity?

- A. "Tell me about physics, chemistry, biology, and astronomy."
- B. "Tell me the best classes to take when attending a university."
- **C. "Provide an overview of state representative election laws in Iowa."**
- D. "Explain how guidelines and regulations are established for businesses."

Answer: C

Explanation:

Specificity is the cornerstone of effective prompt engineering. A specific prompt provides clear boundaries and a narrow focus, which prevents the AI from generating generic or overwhelming amounts of irrelevant information. Option C, "Provide an overview of state representative election laws in Iowa," is the best example because it defines three critical parameters: theSubject(election laws), theScope(state representative level), and theLocation/Jurisdiction(Iowa).

In contrast, options A and D are far too broad; asking for an overview of four major sciences or all business regulations would result in a superficial summary that lacks depth. Option B is subjective and lacks context, as "best classes" depends entirely on the student's major and career goals. By specifying the state and the specific legislative body, the user in Option C allows the AI to access a targeted subset of its training data. In practical applications, this level of specificity significantly reduces the risk of "hallucinations" or factual errors, as the model is guided to a precise factual domain. This is essential in professional research where accuracy and relevance are prioritized over general knowledge.

NEW QUESTION # 48

There have been complaints that deepfake videos on a social media platform are being circulated that show public figures making false statements. Which area of ethical concern does this situation demonstrate?

- A. Privacy and consent
- B. Bias and representation
- C. Regulatory and legal frameworks
- **D. Misinformation and manipulation**

Answer: D

Explanation:

The rise of deepfakes—AI-generated synthetic media that convincingly depicts people saying or doing things they never did—falls squarely under the ethical concern of misinformation and manipulation. This represents a significant challenge to the "Information Integrity" of digital platforms. By creating realistic but false content, generative AI can be used to influence elections, damage reputations, or incite social unrest.

This ethical concern highlights the "dual-use" nature of AI. While the same technology can be used for harmless entertainment or high-end film production, in the hands of bad actors, it becomes a tool for "cognitive hacking." Prompt engineering optimization in this context involves developing guardrails within AI models to prevent the generation of content involving public figures or non-consensual imagery. It also involves the use of AI to detect deepfakes by identifying microscopic inconsistencies in pixels or heart-rate signatures that are invisible to the human eye. Addressing misinformation requires a combination of technical watermarking, robust platform policies, and user education to ensure that the boundary between reality and AI-generated fiction remains clear.

NEW QUESTION # 49

Which task can be accomplished with the data cleaning capabilities of generative AI?

- A. Identifying underlying bias
- B. Drawing valid conclusions
- C. Reducing total volume
- **D. Identifying inaccuracies**

Answer: D

Explanation:

Generative AI models, specifically Large Language Models (LLMs), are highly effective at identifying inaccuracies within a dataset during the data cleaning phase. When provided with a dataset and a prompt to "check for consistency" or "identify anomalies," the AI can cross-reference the data points against its internal knowledge base or the logical rules established in the prompt. For example, if a list of "US States" includes "London," the AI can flag this as an inaccuracy.

This capability extends to identifying spelling errors, formatting inconsistencies (e.g., dates written in multiple formats), and logical contradictions. While AI can help in identifying bias (Option D), that is usually considered a higher-level "auditing" task rather than a standard "cleaning" task. Identifying inaccuracies is a foundational step in the data pipeline; by cleaning the data first, the user ensures that any subsequent analysis or "conclusion drawing" (Option C) is based on high-quality, reliable information. In prompt engineering, this is often performed using the "Self-Correction" or "Reviewer" pattern, where one prompt generates data and a second prompt is used specifically to identify and fix any factual or structural inaccuracies within that output.

NEW QUESTION # 50

A lawyer needs to interact with a database to search for cases relating to college admissions. What is a benefit of writing effective prompts when interacting with the database?

- A. Data modification for improved applicability
- **B. Prevention of sifting through irrelevant results**
- C. Greater capacity for unstructured data storage
- D. Automatic expansion to include more data

Answer: B

Explanation:

For professionals dealing with vast amounts of specialized information, such as lawyers, the primary benefit of effective prompt engineering is the prevention of sifting through irrelevant results. Legal databases are massive, containing millions of precedents, statutes, and opinions. A vague prompt like "Find cases about schools" would return thousands of results, most of which would be useless to a specific case regarding college admissions.

By using specific keywords, Boolean logic, and contextual constraints within the prompt (e.g., "Search for U.S. Supreme Court cases from 2000-2023 specifically addressing affirmative action in private university undergraduate admissions"), the lawyer drastically narrows the search field. This precision is the essence of effective prompting in a professional environment. It saves significant time and cognitive energy by ensuring that the AI or search algorithm acts as a high-resolution filter. This "signal-to-noise" optimization allows the professional to focus on the high-value task of legal analysis rather than the low-value task of manual data sorting. Effective prompts turn a mountain of data into a curated list of relevant evidence.
