Response:

- A. Guided help tutorials
- B. Chatbot
- C. Videos
- D. Live chat with experts

Answer: A,C

NEW QUESTION # 87

What is required to use version management in an SAP Analytics Cloud story?

- A. Planning model
- B. Optimized mode
- C. Analytic model
- D. Classic mode

Answer: A

Explanation:

To leverage version management capabilities within an SAP Analytics Cloud (SAC) story, it is a fundamental requirement that the story is built on a planning model. Version management is a core feature specifically designed for planning functionalities. It enables users to create, manage, and compare different scenarios or iterations of data, such as "Actual," "Budget," "Forecast," or various planning versions. This is critical for budgeting, forecasting, and what-if analysis, allowing planners to work on different data sets concurrently and track changes over time. While analytic models are used for general reporting and analysis, they do not inherently support the robust version management features that are integral to planning processes. Therefore, if you intend to utilize version management to compare different data scenarios or manage planning cycles, your SAC story must be connected to a planning model.

NEW QUESTION # 88

How can you join two existing artifacts in SAP Datasphere? Note: There are 2 correct answers to this question.

- A. Create a graphical view and select the Join node icon.
- B. Create an Analytic Model based on the first artifact and add the second artifact as the Used in property.
- C. Create a graphical view, drag an artifact to the canvas, and the second one on top of the first one.
- D. Create an SQL view with a JOIN operation.

Answer: A,D

Explanation:

In SAP Datasphere, there are distinct methods for joining two existing artifacts, enabling powerful data integration. One common and intuitive approach is to create a graphical view and select the Join node icon (B). In the graphical view editor, you can drag your source artifacts (tables or views) onto the canvas, and then use the dedicated "Join" node to define the join conditions between them, visually mapping the columns and selecting the join type (e.g., inner, left outer). This method is highly visual and user-friendly. Another powerful and flexible way to join artifacts is to create an SQL view with a JOIN operation (C). For users comfortable with SQL, an SQL view allows for direct coding of complex join conditions, including various join types and advanced filtering, offering fine-grained control over the data integration logic. Both methods achieve the goal of combining data from multiple artifacts into a single result set, tailored to different user preferences and complexity requirements.
