## Terraform-Associate-004 Quiz Guide - Terraform-Associate-004 Exam Prep & Terraform-Associate-004 Test Braindumps

FreePdfDump is here to provide you with Terraform-Associate-004 exam dumps. These HashiCorp Terraform-Associate-004 practice test materials will help you secure the Terraform-Associate-004 credential on the first attempt. FreePdfDump resolves every problem of the test aspirants with reliable HashiCorp Terraform-Associate-004 Practice Test material. This Terraform-Associate-004 practice exam imitates the HashiCorp Terraform-Associate-004 real exam pattern. Thus, it helps you kill HashiCorp Terraform-Associate-004 exam anxiety.

## HashiCorp Terraform-Associate-004 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>• Terraform state management: This domain focuses on managing Terraform's state file, understanding local and remote backends, implementing state locking, and handling resource drift.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>• Terraform modules: This domain explains organizing and reusing code through modules, understanding variable scope between modules, implementing modules in configurations, and managing module versions.</li></ul>
Topic 3	<ul style="list-style-type: none"><li>• Core Terraform workflow: This domain focuses on the essential workflow steps: initializing directories, validating configurations, generating execution plans, applying changes, destroying infrastructure, and formatting code.</li></ul>
Topic 4	<ul style="list-style-type: none"><li>• Terraform fundamentals: This domain addresses installing and managing provider plugins, understanding Terraform's provider architecture, and how Terraform tracks infrastructure state.</li></ul>

## HashiCorp Certified: Terraform Associate (004) (HCTA0-004) Sample Questions (Q36-Q41):

### NEW QUESTION # 36

Which of the following command would be use to access all of the attributes and details of a resource managed by Terraform?

- A. Terraform get provider\_type\_name
- B. Terraform state show 'provider\_type\_name'
- C. Terraform state list provider\_type\_name
- D. Terraform state list

**Answer: B**

Explanation:

This is the command that you would use to access all of the attributes and details of a resource managed by Terraform, by providing the resource address as an argument. For example, terraform state show 'aws\_instance.example' will show you all the information about the AWS instance named example.

### NEW QUESTION # 37

You can define multiple backend blocks in your Terraform configuration to store your state in multiple locations.

- A. True
- B. False

**Answer: B**

Explanation:

Rationale for Correct answer: A Terraform configuration supports only one backend at a time. The backend determines where state is stored and how locking works. Terraform does not support writing the same state to multiple backends simultaneously via multiple backend blocks.

Analysis of Incorrect Options (Distractors):

A (True): Incorrect-Terraform allows only a single backend configuration for a given working directory/root module.

Key Concept: Single-backend design: one state location per configuration/workspace.

### NEW QUESTION # 38

Why would you use the -replace flag for terraform apply?

- A. You want Terraform to ignore a resource on the next apply.
- B. You want to force Terraform to destroy a resource on the next apply.

- C. You want to force Terraform to destroy and recreate a resource on the next apply.
- D. You want Terraform to destroy all the infrastructure in your workspace.

**Answer: C**

Explanation:

Rationale for Correct answer: terraform apply -replace=ADDRESS forces Terraform to replace the specified resource during the next apply, meaning it will plan to destroy and then recreate it (or create-before-destroy if the resource supports it and the graph/lifecycle allows). This is used when a resource is unhealthy, drifted in a way that's hard to correct, or you want a fresh instance without changing configuration.

Analysis of Incorrect Options (Distractors):

A: Incorrect--replace is not "destroy only"; it's destroy + recreate.

B: Incorrect-ignoring changes is done with lifecycle ignore\_changes, not -replace.

D: Incorrect-destroying everything is terraform destroy (or apply with all resources removed), not -replace.

Key Concept: Forcing resource replacement using -replace in the apply workflow.

Reference:

### NEW QUESTION # 39

What Terraform command always causes a state file to be updated with changes that might have been made outside of Terraform?

- A. Terraform apply -lock=false
- B. Terraform show -json
- C. Terraform plan -refresh-only
- D. Terraform plan target-state

**Answer: C**

Explanation:

This is the command that always causes a state file to be updated with changes that might have been made outside of Terraform, as it will only refresh the state file with the current status of the real resources, without making any changes to them or creating a plan.

### NEW QUESTION # 40

You have multiple team members collaborating on infrastructure as code (IaC) using Terraform, and want to apply formatting standards for readability.

How can you format Terraform HCL (HashiCorp Configuration Language) code according to standard Terraform style convention?

- A. Write a shell script to transform Terraform files using tools such as AWK, Python, and sed
- B. Run the terraform fmt command during the code linting phase of your CI/CD process Most Voted
- C. Designate one person in each team to review and format everyone 's code
- D. Manually apply two spaces indentation and align equal sign "=" characters in every Terraform file (\*.tf)

**Answer: B**

Explanation:

The terraform fmt command is used to rewrite Terraform configuration files to a canonical format and style.

This command applies a subset of the Terraform language style conventions, along with other minor adjustments for readability.

Running this command on your configuration files before committing them to source control can help ensure consistency of style between different Terraform codebases, and can also make diffs easier to read. You can also use the -check and -diff options to check if the files are formatted and display the formatting changes respectively<sup>2</sup>. Running the terraform fmt command during the code linting phase of your CI/CD process can help automate this process and enforce the formatting standards for your team. References = [Command: fmt] <sup>2</sup>

### NEW QUESTION # 41

.....

If you plan to apply for the HashiCorp Certified: Terraform Associate (004) (HCTA0-004) (Terraform-Associate-004) certification exam, you need the best Terraform-Associate-004 practice test material that can help you maximize your chances of success. You

cannot rely on invalid Terraform-Associate-004 Materials and then expect the results to be great. So, you must prepare from the updated HashiCorp Terraform-Associate-004 Exam Dumps to crack the Terraform-Associate-004 exam
