Unparalleled XK0-005 Upgrade Dumps & Passing XK0-005 Exam is No More a Challenging Task

So rest assured that you will get top-notch and easy-to-use CompTIA XK0-005 practice questions. The CompTIA Linux+ Certification Exam (XK0-005) PDF dumps file is the PDF version of real CompTIA Linux+ Certification Exam (XK0-005) exam questions that work with all devices and operating systems. Just download the CompTIA Linux+ Certification Exam (XK0-005) PDF dumps file and start the CompTIA Linux+ Certification Exam (XK0-005) exam questions preparation right now. Whereas the other two CompTIA Linux+ Certification Exam (XK0-005) practice test software is concerned, both are the mock CompTIA XK0-005 exam dumps and help you to provide the real-time CompTIA Linux+ Certification Exam (XK0-005) exam environment for preparation.

CompTIA Linux+ Certification Exam Sample Questions (Q434-Q439):

NEW QUESTION # 434

A Linux administrator is configuring a new internal web server fleet. The web servers are up and running but can only be reached by users directly via IP address. The administrator is attempting to fix this inconvenience by requesting appropriate records from the DNS team. The details are:

Hostname: devel.comptia.org

IP address: 5.5.5.1, 5.5.5.2, 5.5.5.3, 5.5.5.4

Name server: 5.5.5.254

Additional names: dev.comptia.org, development.comptia.org

Which of the following types of DNS records should the Linux administrator request from the DNS team? (Select three).

- A. PTR
- B. SOA
- C. SRV
- **D. NS**
- E. RRSIG
- **F. A**
- G. MX
- H. TXT
- **I. CNAME**

Answer: D,F,I

Explanation:

The Linux administrator should request the following types of DNS records from the DNS team:

A: This record type is used to map a hostname to an IPv4 address. The administrator needs four A records for devel.comptia.org, one for each IP address (5.5.5.1, 5.5.5.2, 5.5.5.3, 5.5.5.4). This will allow users to access the web servers by using the hostname devel.comptia.org instead of the IP addresses¹.

CNAME: This record type is used to create an alias for another hostname. The administrator needs two CNAME records, one for dev.comptia.org and one for development.comptia.org, both pointing to devel.comptia.org. This will allow users to access the web servers by using any of these three hostnames interchangeably¹.

NS: This record type is used to delegate a domain or a subdomain to another name server. The administrator needs one NS record for comptia.org, pointing to 5.5.5.254, which is the name server that hosts the records for the subdomain devel.comptia.org². This will allow users to resolve the hostnames under comptia.org by querying the name server 5.5.5.254².

The other record types are not relevant for the administrator's task:

MX: This record type is used to specify the mail exchange server for a domain or a subdomain¹. The administrator does not need this record type because the web servers are not intended to handle email traffic.

PTR: This record type is used to map an IP address to a hostname, which is the reverse of an A record¹. The administrator does not need this record type because the web servers are not expected to be accessed by their IP addresses.

RRSIG: This record type is used to provide digital signatures for DNSSEC, which is a security extension for DNS that verifies the authenticity and integrity of DNS responses³. The administrator does not need this record type because it is not mentioned in the task requirements.

SOA: This record type is used to provide information about the authoritative name server and other parameters for a domain or a subdomain¹. The administrator does not need this record type because it is usually created automatically by the name server software when a new zone file is created⁴.

TXT: This record type is used to store arbitrary text data that can be used for various purposes, such as SPF, DKIM, DMARC, etc¹. The administrator does not need this record type because it is not related to the web server functionality.

SRV: This record type is used to specify the location and port number of a service that runs on a domain or a subdomain¹. The administrator does not need this record type because the web servers use the standard HTTP port 80, which does not require an SRV record.

NEW QUESTION # 435

Users report that connections to a MariaDB service are being closed unexpectedly. A systems administrator troubleshoots the issue and finds the following message in /var/log/messages:

Which of the following is causing the connection issue?

- A. The amount of RAM allocated to the server is too high.
- B. The process mysqld is using too many semaphores.
- C. Something is starving the server resources.
- **D. The server is running out of file descriptors.**

Answer: D

Explanation:

The message in /var/log/messages indicates that the server is running out of file descriptors. A file descriptor is a non-negative integer identifier for an open file in Linux. Each process has a table of open file descriptors where a new entry is appended upon opening a new file. There is a limit on how many file descriptors a process can open at a time, which depends on the system configuration and

the user privileges. If a process tries to open more files than the limit, it will fail with an error message like "Too many open files". This could cause connections to be closed unexpectedly or other problems with the application.

NEW QUESTION # 436

A non-privileged user is attempting to use commands that require elevated account permissions, but the commands are not successful. Which of the following most likely needs to be updated?

- A. /etc/shadow
- B. /etc/bashrc
- C. /etc/passwd
- D. /etc/sudoers

Answer: D

Explanation:

Explanation

The /etc/sudoers file is used to configure the sudo command, which allows non-privileged users to execute commands that require elevated account permissions. The file contains a list of users and groups that are allowed to use sudo, and the commands they can run with it. The file also defines the security policy for sudo, such as whether a password is required, how long the sudo session lasts, and what environment variables are preserved or reset.

The /etc/passwd file is used to store information about the user accounts on the system, such as their username, user ID, home directory, and login shell. The /etc/shadow file is used to store the encrypted passwords for the user accounts, along with other information such as password expiration and aging. These files are not directly related to the sudo command, and updating them will not grant a user elevated account permissions.

The /etc/bashrc file is used to set up the environment for the bash shell, such as aliases, functions, variables, and options. This file is executed whenever a new bash shell is started, and it affects all users on the system.

However, this file does not control the sudo command or its configuration, and updating it will not allow a user to use commands that require elevated account permissions.

NEW QUESTION # 437

An administrator thinks that a package was installed using a snap. Which of the following commands can the administrator use to verify this information?

- A. snap install
- B. snap list
- C. snap find
- D. snap try

Answer: B

Explanation:

The snap list command lists all installed snap packages on the system. It provides details such as the package name, version, and installation status. This command is useful for verifying whether a specific package was installed using the snap package manager.

NEW QUESTION # 438

An administrator created an initial Git repository and uploaded the first files. The administrator sees the following when listing the repository:

□ The administrator notices the file .DS STORE should not be included and deletes it from the online repository. Which of the following should the administrator run from the root of the local repository before the next commit to ensure the file is not uploaded again in future commits?

- A. rm -f .DS STORE && git rebase origin main
- B. git fetch && git checkout .DS STORE
- C. rm -f .DS STORE && git push
- D. echo .DS STORE >> .gitignore

Answer: D

Explanation:

Explanation

The correct answer is D. The administrator should run "echo .DS STORE >> .gitignore" from the root of the local repository before the next commit to ensure the file is not uploaded again in future commits.

This command will append the file name .DS STORE to the end of the .gitignore file, which is a special file that tells Git to ignore certain files or directories that should not be tracked or uploaded to the repository. By adding .DS STORE to the .gitignore file, the administrator will prevent Git from staging, committing, or pushing this file in the future.

The other options are incorrect because:

A: `rm -f .DS STORE && git push`

This command will delete the file .DS STORE from the local repository and then push the changes to the remote repository. However, this does not prevent the file from being uploaded again in future commits, if it is recreated or copied to the local repository.

B: `git fetch && git checkout .DS STORE`

This command will fetch the latest changes from the remote repository and then restore the file .DS STORE from the remote repository to the local repository. This is not what the administrator wants to do, as this will undo the deletion of the file from the online repository.

C: `rm -f .DS STORE && git rebase origin main`

This command will delete the file .DS STORE from the local repository and then rebase the local branch onto the main branch of the remote repository. This will rewrite the commit history of the local branch and may cause conflicts or errors. This is not what the administrator wants to do, as this is a risky and unnecessary operation.

NEW QUESTION # 439

.....

No company in the field can surpass us on the XK0-005 exam questions. So we still hold the strong strength in the market as a leader. At present, our XK0-005 guide materials have applied for many patents. We attach great importance on the protection of our intellectual property. And our website is so famous that it is easily recognised by the candidates as a popular brand among all of the webistes. And a lot of our loyal customers only trust our XK0-005 Study Guide for their exam as well.

XK0-005 Test Papers: <https://www.practicevce.com/CompTIA/XK0-005-practice-exam-dumps.html>

Three formats of our study material are CompTIA XK0-005 exam PDF questions, desktop practice test software, and web-based XK0-005 practice test, Get 24/7 Customer Support For XK0-005 Pdf Questions, Under the leadership of a professional team, we have created the most efficient learning XK0-005 training guide for our users, PracticeVCE have made this format so that users don't face the hassles of installing software while preparing for the CompTIA Linux+ Certification Exam (XK0-005) certification.

Learn techniques and abstractions for proper XK0-005 I/O handling, Converting Simple Variables to Objects and Back, Three formats of our study material are CompTIA XK0-005 Exam PDF questions, desktop practice test software, and web-based XK0-005 practice test.

2026 The Best XK0-005 Upgrade Dumps | CompTIA Linux+ Certification Exam 100% Free Test Papers

Get 24/7 Customer Support For XK0-005 Pdf Questions, Under the leadership of a professional team, we have created the most efficient learning XK0-005 training guide for our users.

PracticeVCE have made this format so that users don't face the hassles of installing software while preparing for the CompTIA Linux+ Certification Exam (XK0-005) certification, XK0-005 Exam 5-star Rating with a Huge Customer Base.
