Cisco Certified Support Technician (CCST) Cybersecurity Sample Questions (Q296-Q301):

NEW QUESTION # 296
What is the highest level of risk for a cybersecurity vulnerability that poses an immediate and significant threat to critical assets, systems, or data?

- A. Medium risk
- B. Low risk
- C. High risk
- D. Extremely high risk

Answer: D

Explanation:
The highest level of risk for a cybersecurity vulnerability that poses an immediate and significant threat to critical assets, systems, or data is categorized as an extremely high risk. Vulnerabilities at this level represent a severe and imminent danger to an organization's key resources and require immediate attention and mitigation efforts to minimize potential harm or losses.

NEW QUESTION # 297
Which type of encryption algorithm uses two different keys: a public key for encryption and a private key for decryption?

- A. Asymmetric encryption
- B. Hashing algorithm
- C. Symmetric encryption
- D. HMAC algorithm

Answer: A

Explanation:
Asymmetric encryption, also known as public-key encryption, uses a pair of keys: a public key and a private key. The public key is used for encryption, while the private key is used for decryption. This allows for secure communication over an insecure channel, as the public key can be shared freely without compromising the security of the message.

NEW QUESTION # 298
Which level of risk category would be associated with a vulnerability that has the potential to cause minor financial loss or impact?

- A. Medium risk
- B. Extremely high risk
- C. Low risk
- D. High risk

Answer: C

Explanation:
A vulnerability that has the potential to cause minor financial loss or impact would be categorized as a low-risk level. Low-risk vulnerabilities pose a relatively smaller threat to an organization's assets, systems, or data. While they should not be ignored, low-risk vulnerabilities typically require less immediate attention and resources to mitigate.

NEW QUESTION # 299
What is a common security threat in which an attacker attempts to overwhelm a targeted system by flooding it with Internet traffic?

- A. Distributed Denial of Service (DDoS) attack
- B. Ransomware
- C. Phishing
- D. SQL injection

Answer: A

Explanation:
Option 1: Ransomware is a type of malicious software that encrypts a victim's files and demands a ransom in exchange for the decryption key. While it can cause damage to systems, it is not specifically designed to overwhelm a system with Internet traffic.
Option 2: Correct. A Distributed Denial of Service (DDoS) attack is a common security threat in which an attacker attempts to overwhelm a targeted system by flooding it with Internet traffic. This can result in a loss of service availability for legitimate users.
Option 3: Phishing is a type of social engineering attack in which an attacker masquerades as a trustworthy entity to trick individuals into providing sensitive information. It does not involve overwhelming a system with Internet traffic.
Option 4: SQL injection is a type of web application attack in which an attacker manipulates a SQL query to gain unauthorized access to a database. It does not involve overwhelming a system with Internet traffic.

NEW QUESTION # 300
What is the purpose of incident response planning in cybersecurity?

- A. To conduct forensic investigations after cybersecurity incidents
- B. To prevent cybersecurity incidents from occurring
- C. To recover from cybersecurity incidents and restore normal business operations
- D. To detect and respond to cybersecurity incidents in a timely and effective manner

Answer: D

Explanation:
Incident response planning in cybersecurity focuses on establishing processes and procedures to detect, respond to, and mitigate the impact of cybersecurity incidents. It ensures that organizations have the necessary measures in place to identify incidents promptly, contain them, and minimize the potential damage. The goal is to respond to incidents in a timely and effective manner to protect sensitive data and maintain business continuity.
