Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q69-Q74):

NEW QUESTION # 69

An administrator deploys Portworx in the "portworx" namespace.

What command should the administrator use to check status of only the Portworx pods?

- A. `kubectl -n portworx get pods -o wide`
- B. `kubectl -n portworx get pods -l name=portworx`
- C. `kubectl -n portworx get storagecluster`

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To view the status of only Portworx pods within the "portworx" namespace, administrators should use label selectors with `kubectl`. The command `kubectl -n portworx get pods -l name=portworx` filters pods by the label `name=portworx`, showing only pods related to the Portworx deployment. This is more precise than simply listing all pods with `-o wide`, which includes unrelated pods. Checking Portworx pods' status is crucial for monitoring cluster health, identifying pod restarts, or troubleshooting failures. The Portworx installation manifests and documentation specify labels applied to Portworx pods, enabling operators to filter efficiently. Using this command supports focused operational monitoring and streamlined debugging within Kubernetes environments running Portworx **【Pure Storage Portworx Kubernetes Guide source】** .

NEW QUESTION # 70

What information is included in the Portworx diagnostics bundle (diags)?

- A. Application logs, Kubernetes events, and network configurations
- B. User activity logs, security policies, and firewall rules
- C. **Portworx journal logs, CLI command outputs, and basic OS information**

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The Portworx diagnostics bundle, known as "diags," aggregates comprehensive diagnostic data for troubleshooting. This includes Portworx journal logs, which record detailed system and service events essential for identifying errors or malfunctions. Additionally, the bundle contains outputs from key CLI commands such as `pxctl status` and `pxctl volume list` that provide snapshots of the cluster's health, volume states, and configuration at the time of collection. Basic operating system information, including kernel version, disk hardware details, and network interfaces, is also captured to understand the underlying environment. Together, these components equip Portworx support and administrators with the contextual data needed for effective root cause analysis and faster issue resolution. The official Portworx support documentation recommends collecting and submitting this bundle for all significant troubleshooting cases as it expedites problem diagnosis and resolution **【Pure Storage Portworx Support Guide source】** .

NEW QUESTION # 71

Which command can be used to migrate volumes after cluster pairing is finished?

- A. `strokctl cloudmigrate start`
- B. `kubectl cloudmigrate`
- C. `pxctl cloudmigrate start`

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Once two Portworx clusters are paired, for example in disaster recovery setups, data migration between them can be initiated. The command `pxctl cloudmigrate start` triggers this migration process. It synchronizes volumes, ensuring that data is copied securely and consistently from the source cluster to the destination. This migration is transparent to applications and supports incremental syncs, which helps reduce downtime. The CLI command also provides operational feedback and logs for administrators to monitor progress. Portworx's documentation on disaster recovery workflows emphasizes this command as essential for starting volume migration post-cluster pairing, streamlining data protection and business continuity strategies across multiple sites or cloud regions [【Pure Storage Portworx Disaster Recovery Guide source】](#) .

NEW QUESTION # 72

An administrator wants to check the size, availability, and usage of all pools in the cluster.

Which command should the administrator use?

- A. `pxctl cluster provision-status`
- B. `pxctl service pool show`
- C. `kubectl get storagecluster`

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To view detailed information about storage pools in a Portworx cluster—including size, availability, usage, and health—administrators should use the command `pxctl service pool show`. This CLI command provides a comprehensive overview of all storage pools configured on cluster nodes, including pool IDs, device names, pool sizes, free space, and status. It helps administrators monitor resource utilization, detect degraded pools, and plan capacity expansions. While `kubectl get storagecluster` shows the overall cluster CRD status and `pxctl cluster provision-status` shows provisioning status, neither provides detailed pool-level insights. Portworx's operational documentation recommends `pxctl service pool show` as the definitive command for monitoring pool resources and ensuring storage health across the cluster [【Pure Storage Portworx CLI Guide source】](#) .

NEW QUESTION # 73

What does the DriveStateChange alert indicate?

- A. Free disk space going below the recommended level of 20%
- B. Free disk space going below the recommended level of 10%
- C. Free volume space going below the recommended level of 5%

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The DriveStateChange alert in Portworx indicates that free disk space on a storage device has fallen below the recommended threshold of 10%. This alert warns administrators that storage capacity on a particular disk is critically low and that immediate action may be needed to avoid performance degradation or failures. Monitoring disk space is essential to maintain cluster health and prevent data loss. Portworx automatically generates this alert as part of its proactive monitoring system, providing early warning so operators can add capacity, remove unnecessary data, or re-balance workloads. The alert documentation advises maintaining sufficient free space to ensure optimal performance and data durability in the Portworx cluster [【Pure Storage Portworx Alerting Guide source】](#) .
