### Salesforce Certified MuleSoft Associate Sample Questions (Q33-Q38):

#### NEW QUESTION # 33

A platform architect includes both an API gateway and a service mesh in the architecture of a distributed application for communication management.

Which type of communication management does a service mesh typically perform in this architecture?

- A. Between the application and external API clients
- B. Between application services and the firewall
- C. Between the application and external API implementations
- **D. Between services within the application**

**Answer: D**

Explanation:

A service mesh is typically used to manage communication between microservices within a distributed application. Here's a detailed explanation:

Service Mesh:

Definition: A service mesh is a dedicated infrastructure layer that manages service-to-service communication within a microservices architecture.

Features: Provides features such as load balancing, service discovery, traffic management, and security (e.g., mutual TLS).

Intra-Application Communication:

Focus: It focuses on internal communication between microservices, ensuring reliability, security, and observability of inter-service communications.

Management: Handles retries, circuit breaking, and service-to-service authentication transparently.

API Gateway:

Complementary Role: While a service mesh manages internal microservice communications, an API gateway manages external client

requests and provides a single entry point for external API clients.  
Service Mesh Overview: What is a Service Mesh?  
Service Mesh vs. API Gateway: Service Mesh and API Gateway Comparison

#### NEW QUESTION # 34

An integration architect is designing an API that must accept requests from API clients for both XML and JSON content over HTTP/1.1 by default.

Which API architectural style when used for its intended and typical purposes, should the architect choose to meet these requirements?

- A. REST
- B. SOAP
- C. gRPC
- D. GraphQL

**Answer: A**

Explanation:

REST (Representational State Transfer) is an architectural style commonly used for designing networked applications, particularly APIs that need to handle multiple content types over HTTP. Here's a detailed explanation:

Content Negotiation:

Definition: REST APIs support content negotiation, allowing clients to request either XML or JSON formats by setting the Accept header in HTTP requests.

Flexibility: This capability makes REST ideal for scenarios where an API needs to serve multiple content types.

HTTP Protocol:

Usage: REST APIs operate over HTTP/1.1, making them compatible with web standards and easily accessible by various clients (browsers, mobile apps, etc.).

Methods: Supports standard HTTP methods like GET, POST, PUT, DELETE, allowing for CRUD operations.

Advantages:

Stateless: Each request from a client to server must contain all the information needed to understand and process the request.

Scalability: RESTful services can handle a high load of requests efficiently.

REST API Design: RESTful Web Services

Content Negotiation: HTTP Content Negotiation

#### NEW QUESTION # 35

Which Exchange asset type represents a complete API specification in RAML or OAS format?

- A. SOAP APIs
- B. Connectors
- C. API Spec Fragments
- D. REST APIs

**Answer: D**

Explanation:

In Anypoint Exchange, a REST API asset represents a complete API specification in RAML (RESTful API Modeling Language) or OAS (OpenAPI Specification) format. Here's a detailed explanation:

REST APIs:

Definition: REST APIs are application programming interfaces that adhere to the principles of REST, allowing interaction with RESTful web services.

Specifications: Typically defined using RAML or OAS to describe the API's endpoints, methods, request/response structures, and security protocols.

Asset Types in Anypoint Exchange:

REST APIs: Represent the full API specification, including all necessary details for developers to understand and use the API.

SOAP APIs: Define APIs following the SOAP protocol, often using WSDL.

Connectors: Provide pre-built connectivity to various systems and services.

API Spec Fragments: Reusable pieces of an API specification, such as data types or security schemes, that can be included in full API specifications.

Usage:

Discoverability: Developers can easily discover, review, and reuse these API specifications in their projects.

Documentation: Provides comprehensive documentation generated from the API specification, ensuring consistency and clarity.

MuleSoft Documentation: REST APIs in Exchange

RAML and OAS: RAML, OpenAPI

### NEW QUESTION # 36

A developer is examining the responses from a RESTful web service that is compliant with the Hypertext Transfer Protocol (HTTP/1.1) as defined by the Internet Engineering Task Force (IETF).

In this HTTP/1.1-compliant web service, which class of HTTP response status codes should be specified to indicate when client requests are successfully received, understood and accepted by the web service?

- A. 5xx
- **B. 2xx**
- C. 4xx
- D. 3xx

**Answer: B**

Explanation:

In HTTP/1.1, response status codes are categorized to indicate the result of a client's request. Here's a detailed explanation of the 2xx class of HTTP response status codes:

2xx Success Codes:

Definition: The 2xx class of status codes indicates that the client's request was successfully received, understood, and accepted by the server.

Common Codes:

200 OK: The request has succeeded.

201 Created: The request has been fulfilled and resulted in a new resource being created.

202 Accepted: The request has been accepted for processing, but the processing is not complete.

204 No Content: The server successfully processed the request, but there is no content to return.

Importance:

Client Acknowledgment: These codes inform the client that their request was processed successfully, enabling appropriate client-side actions.

RESTful Standards: Adhering to these standards ensures consistent and predictable API behavior.

IETF RFC 7231: HTTP/1.1 Semantics and Content

HTTP Status Codes: HTTP Status Code Definitions
