If you have any questions about the Desktop-Specialist learning materials, do not hesitate and ask us in your anytime, we are glad to answer your questions and help you use our Desktop-Specialist study questions well. We believe our perfect service will make you feel comfortable when you are preparing for your Desktop-Specialist exam and you will pass the Desktop-Specialist exam.

Tableau Desktop Specialist Exam Sample Questions (Q10-Q15):

NEW QUESTION # 10

Which of the following can help us focus on specific data without removing data in the visualization?

- A. **Highlighters**
- B. Sets
- C. Clusters
- D. Filters

Answer: A

Explanation:

From the official documentation:

When you have a view with a large amount of data you might want to explore your data interactively and highlight a specific mark or group of marks while still maintaining the context of where those marks show in your view.

To do this you can turn on the **Highlighter** for one or more discrete fields that are included in your view and that affect the level of detail Example - Here we just want to focus on Public Affairs college dimension, but don't want to filter out or remove the rest of the data:

Chart, scatter chart Description automatically generated

Note that filtering is not the correct option since that would REMOVE the data that doesn't match the filtering criteria.

NEW QUESTION # 11

_____ is useful when you need to change how the data source is configured on a sheet-by-sheet basis, and when you want to combine databases that don't allow relationships or joins

- A. Union
- B. Data segregation
- C. **Data Blending**
- D. Data Joining

Answer: C

Explanation:

Explanation

Data blending is performed on a sheet-by-sheet basis and is established when a field from a second data source is used in the view. To create a blend in a workbook already connected to at least two data sources, bring a field from one data source to the sheet-it becomes the primary data source.

Switch to the other data source and use a field on the same sheet-it becomes a secondary data source. An orange linking icon will appear in the data pane, indicating which field(s) are being used to blend the data sources.

According to the official Tableau Documentation:

To read more about Data Blending, click on [THIS link](#).

NEW QUESTION # 12

Which statement accurately describes a join?

- A. A combination of rows appended from different tables that have the same column names
- B. A combination of columns appended from different tables that have similar values
- C. **Away to combine table columns in relational databases by using shared values**
- D. Away to combine multiple Tableau workbooks using similar data sources

Answer: C

Explanation:

According to the [Tableau Desktop Specialist Exam Guide], a join is a way to combine table columns in relational databases by using shared values. A join can be inner, left, right, or full, depending on how the matching rows are included or excluded.

NEW QUESTION # 13

In which situation should you save a workbook as a PDF document?

- A. You want document users to be able to filter and sort the views.
- B. Your users have Tableau Desktop but not Tableau Reader.
- C. **You need paper copies of the workbook.**
- D. Your analysis does not require a live connection to a data source.

Answer: C

Explanation:

You should save a workbook as a PDF document if you need paper copies of the workbook. A PDF document preserves the layout and formatting of the workbook, and can be easily printed or shared. Saving a workbook as a PDF document is not necessary or useful in the other situations

NEW QUESTION # 14

How does Tableau know at which level to aggregate values?

- A. Tableau doesn't aggregate values, we do!
- B. Aggregation is always done by using Tableau special formulas
- C. Values are always aggregated at the level of the Date Part
- D. Values are always aggregated at the level of granularity of the worksheet.

Answer: D

Explanation:

In Tableau, you can aggregate measures or dimensions, though it is more common to aggregate measures.

Whenever you add a measure to your view, an aggregation is applied to that measure by default. The type of aggregation applied varies depending on the context of the view.

When you add a measure to the view, Tableau automatically aggregates its values. Sum, average, and median are common aggregations; for a complete list, see List of Predefined Aggregations in Tableau.

The current aggregation appears as part of the measure's name in the view. For example, Sales becomes SUM(Sales). Every measure has a default aggregation which is set by Tableau when you connect to a data source. You can view or change the default aggregation for a measure—see Set the Default Aggregation for a Measure.

You can change the aggregation for a measure in the view from its context menu:

□

NEW QUESTION # 15
