Amazon AWS Certified SysOps Administrator - Associate (SOA-C02) Sample Questions (Q453-Q458):

NEW QUESTION # 453

A company is managing many accounts by using a single organization in AWS Organizations. The organization has all features enabled. The company wants to turn on AWS Config in all the accounts of the organization and in all AWS Regions. What should a Sysops administrator do to meet these requirements in the MOST operationally efficient way?

- A. Use AWS CloudFormation StackSets to deploy stack policies that turn on AWS Config in all accounts and in all Regions.
- **B. Use AVVS CloudFormation StackSets to deploy stack instances that turn on AWS Config in all accounts and in all Regions.**
- C. Use service control policies (SCPs) to configure AWS Config in all accounts and in all Regions.
- D. Create a script that uses the AWS CLI to turn on AWS Config in all accounts in the organization. Run the script from the organization's management account.

Answer: B

Explanation:

To enable AWS Config in all accounts and all regions within an AWS Organization, the most operationally efficient method is to use AWS CloudFormation StackSets. This allows you to deploy CloudFormation stacks across multiple AWS accounts and regions from a single CloudFormation template.

* Create CloudFormation Template:

* The template should include the necessary resources to enable AWS Config, such as the AWS::

Config::ConfigurationRecorder, AWS::Config::DeliveryChannel, and AWS::Config::

ConfigurationAggregator resources.

* Create StackSet:

* Open the AWS CloudFormation console at AWS CloudFormation Console.

* Choose Create StackSet and upload your CloudFormation template.

* Configure StackSet:

* Specify the AWS accounts and regions where you want to deploy the stacks.

* Set the deployment options, including the execution role and administrator role.

* Deploy Stack Instances:

* Deploy the stack instances to all specified accounts and regions. This will automatically enable AWS Config in each account and region.

NEW QUESTION # 454

A SysOps administrator is responsible for the performance of an AWS Lambda function. The Lambda function has a timeout of 3 seconds and has values set for provisioned concurrency and reserved concurrency.

Amazon CloudWatch metrics show that the Lambda function is experiencing several throttles each second.

The metrics also show that the Lambda function's average duration is less than 100 ms.

What should the SysOps administrator do to eliminate the function throttles?

- A. Increase the Lambda function's memory.
- **B. Increase the Lambda function's reserved concurrency value.**
- C. Configure a dead-letter queue for the Lambda function.
- D. Increase the Lambda function's provisioned concurrency value.

Answer: B

Explanation:

The scenario indicates:

* Function is being throttled (i.e., invoked more often than allowed)

* Function is fast (< 100ms)

* Provisioned concurrency is set but still throttled

* This suggests the reserved concurrency limit is too low

From the AWS Lambda Concurrency Documentation:

Reserved concurrency limits the maximum concurrency for a function and also guarantees the capacity.

If your invocations exceed the reserved concurrency limit, Lambda throttles the function.

NEW QUESTION # 455

A company has a high-performance Windows workload. The workload requires a storage volume that provides consistent performance of 10,000 IOPS. The company does not want to pay for additional unneeded capacity to achieve this performance. Which solution will meet these requirements with the LEAST cost?

- A. Use an Amazon FSx for Windows File Server file system that is configured with 10,000 IOPS.
- B. Use a Provisioned IOPS SSD (io1) Amazon Elastic Block Store (Amazon EBS) volume that is configured with 10,000 provisioned IOPS.
- C. Use an Amazon Elastic File System (Amazon EFS) file system with Max I/O mode.
- **D. Use a General Purpose SSD (gp3) Amazon Elastic Block Store (Amazon EBS) volume that is configured with 10,000 provisioned IOPS.**

Answer: D

Explanation:

Max IOPS per volume - 16,000

NEW QUESTION # 456

To manage Auto Scaling group instances that have OS vulnerabilities, the SysOps administrator needs an automated patching solution.

Options:

- A. Use AWS Config to scan for operating system vulnerabilities and to patch instances when the instance status changes to NON_COMPLIANT. Send an Amazon Simple Notification Service (Amazon SNS) notification to an operations team to reboot the instances during off-peak hours.
- B. Use EC2 Image Builder pipelines on a schedule to create new Amazon Machine Images (AMIs) and new launch templates that reference the new AMIs. Use the instance refresh feature for EC2 Auto Scaling to replace instances.
- **C. Use AWS Systems Manager Patch Manager to patch the instances during a scheduled maintenance window. In the AWS-RunPatchBaseline document, ensure that the RebootOption parameter is set to RebootIfNeeded.**
- D. In the Auto Scaling launch template, provide an Amazon Machine Image (AMI) ID for an AWS-provided base image. Update the user data with a shell script to download and install patches.

Answer: C

Explanation:

Using AWS Systems Manager Patch Manager with a maintenance window is a best practice for automating OS patch management across instances in an Auto Scaling group.

Patch Manager: Allows for scheduled patching according to maintenance windows, ensuring minimal impact on application uptime.

RebootOption parameter: Setting this to RebootIfNeeded ensures patches are applied fully when a reboot is required.

AWS-RunPatchBaseline: This document automates the patching process and can be customized based on compliance requirements.

NEW QUESTION # 457

A company is creating a new multi-account architecture. A Sysops administrator must implement a login solution to centrally manage user access and permissions across all AWS accounts. The solution must be integrated with AWS Organizations and must be connected to a third-party Security Assertion Markup Language (SAML) 2.0 identity provider (IdP).

What should the SysOps administrator do to meet these requirements?

- A. Federate the third-party IdP with AWS Identity and Access Management (IAM) for each AWS account in the organization.
- **B. Enable and configure AWS Single Sign-On with the third-party IdP.**
- C. Integrate the third-party IdP directly with AWS Organizations.
- D. Configure an Amazon Cognito user pool. Integrate the user pool with the third-party IdP.

Answer: B

Explanation:

AWS IAM Identity Center makes it easy to centrally manage federated access to multiple AWS accounts and business applications and provide users with single sign-on access to all their assigned accounts and applications from one place. You can use AWS IAM Identity Center for identities in the AWS IAM Identity Center's user directory, your existing corporate directory, or external IdP.
